Many logins for one person

Compass can only put a person in one firm, so a person who works for the group gets a login per firm — then one more per system.

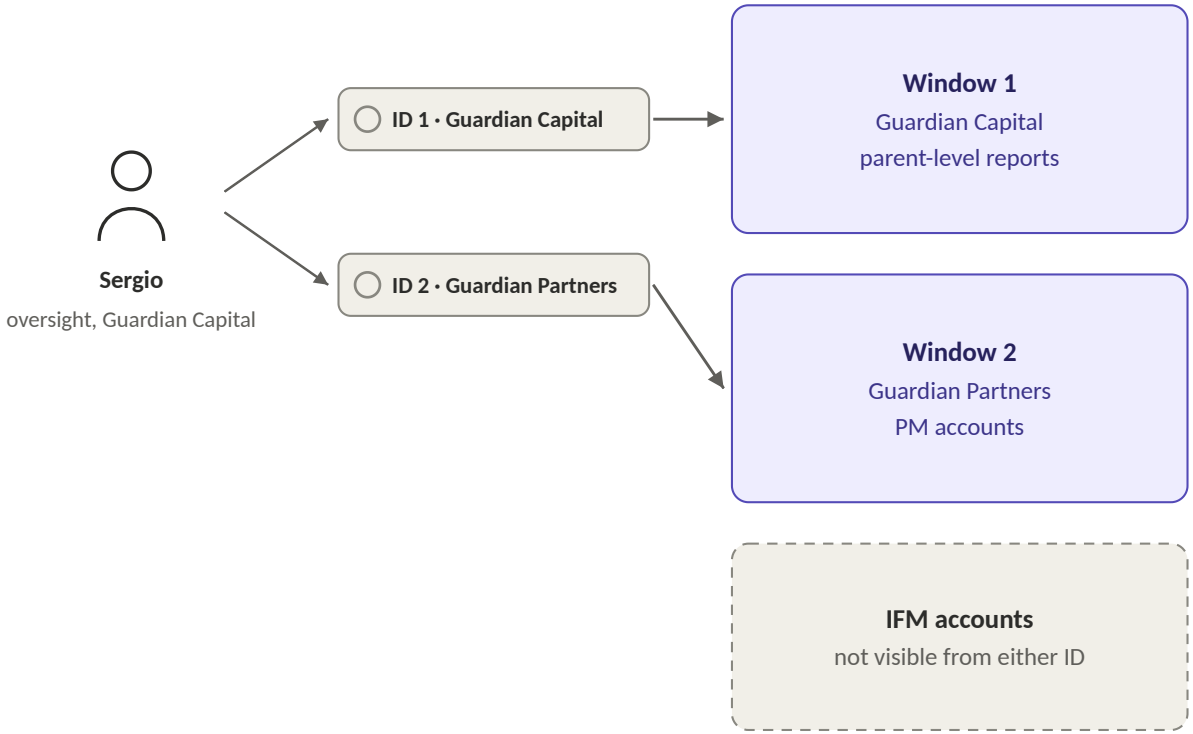

Four firms shown; Harbourfront has more entities and R2 logins existed until recently — hence up to 28.

No single view of the group

Head office cannot look at the whole group at once; every firm is a separate window, and some things are not visible from any of them.

Harbourfront, same problem

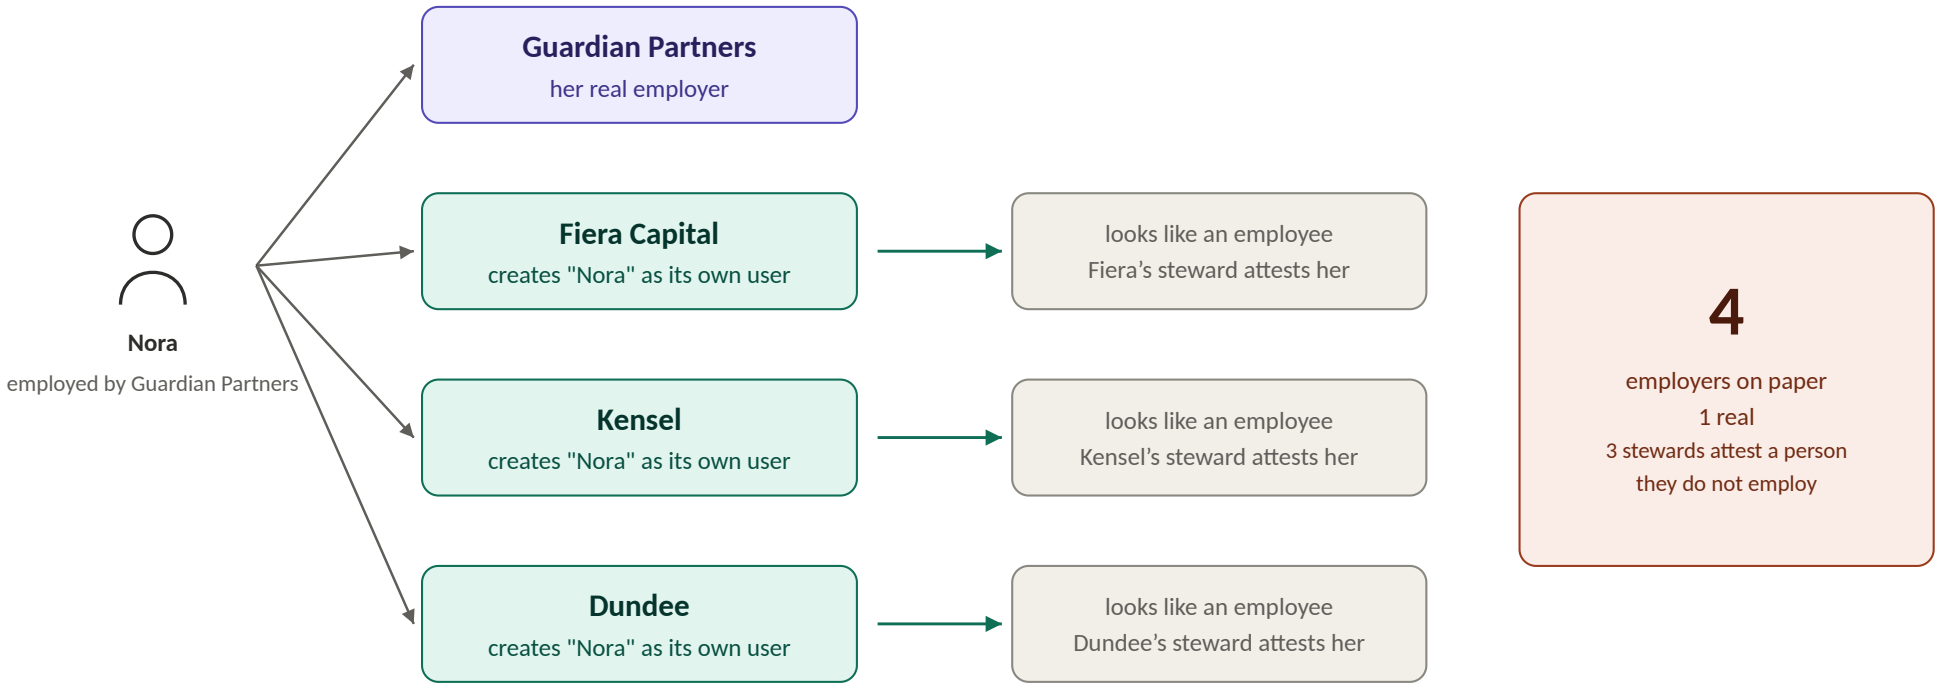

four firms = four separate windows
no search across the whole book
Web Panagon reports cannot be merged

nobody sees the group as one thing

Source: Guardian discovery; Harbourfront discovery

Set up as someone else’s employee

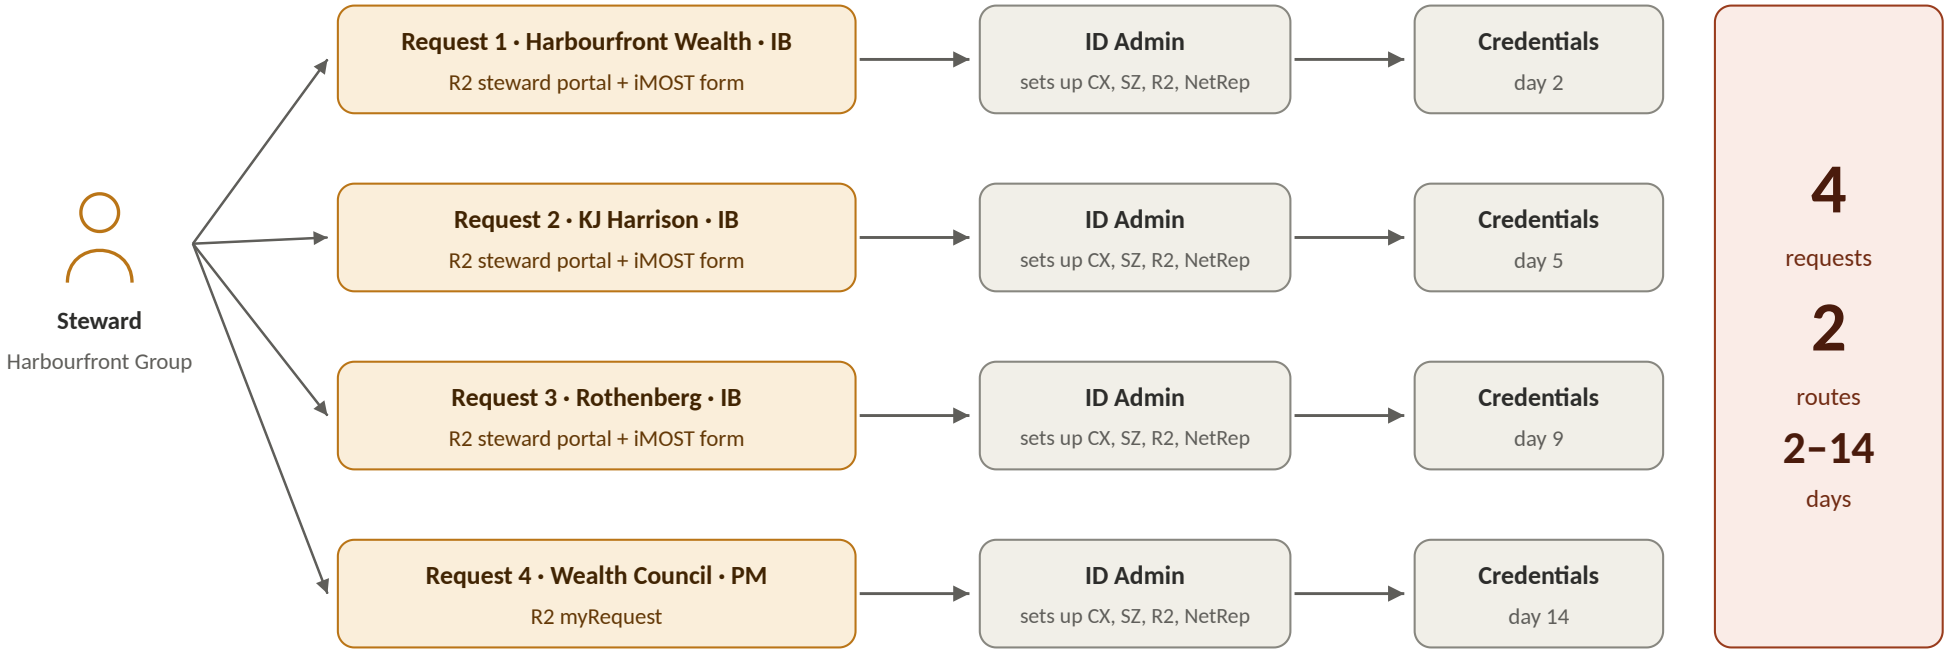

To let a sub-advisor trade, each firm that owns the clients creates the sub-advisor’s staff inside its own firm, as if they worked there.

A request for every firm

Onboarding multiplies twice: once by firm, because a person needs an identity in every firm they touch, and again by route, because IB and PM firms request differently.

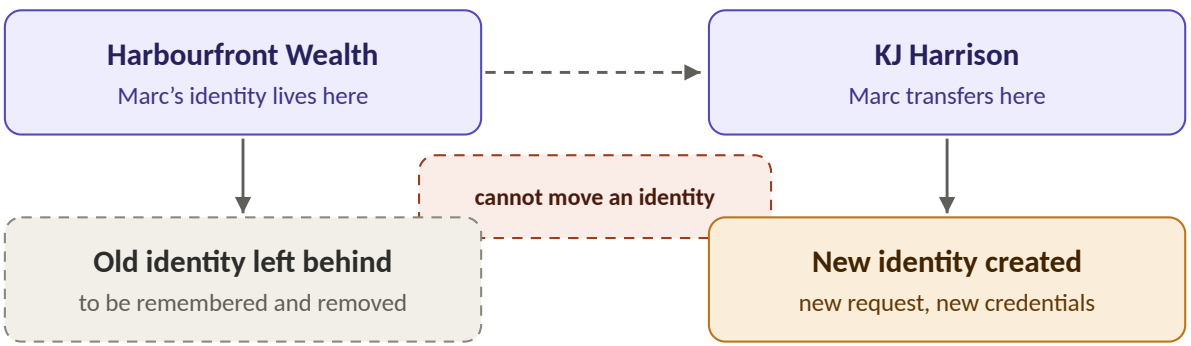

Every later change — a new branch, a new feature — costs the same number of requests again.

Moving within the group means starting over

Because an identity is tied to one firm, every normal move inside a group — a transfer, a promotion to head office, a merger — means delete and recreate.

Aaron promoted to group ops
set up again at every firm he now covers

Sister firm's RR codes added
cross-broker check errors → a third ID (NCS-12294)

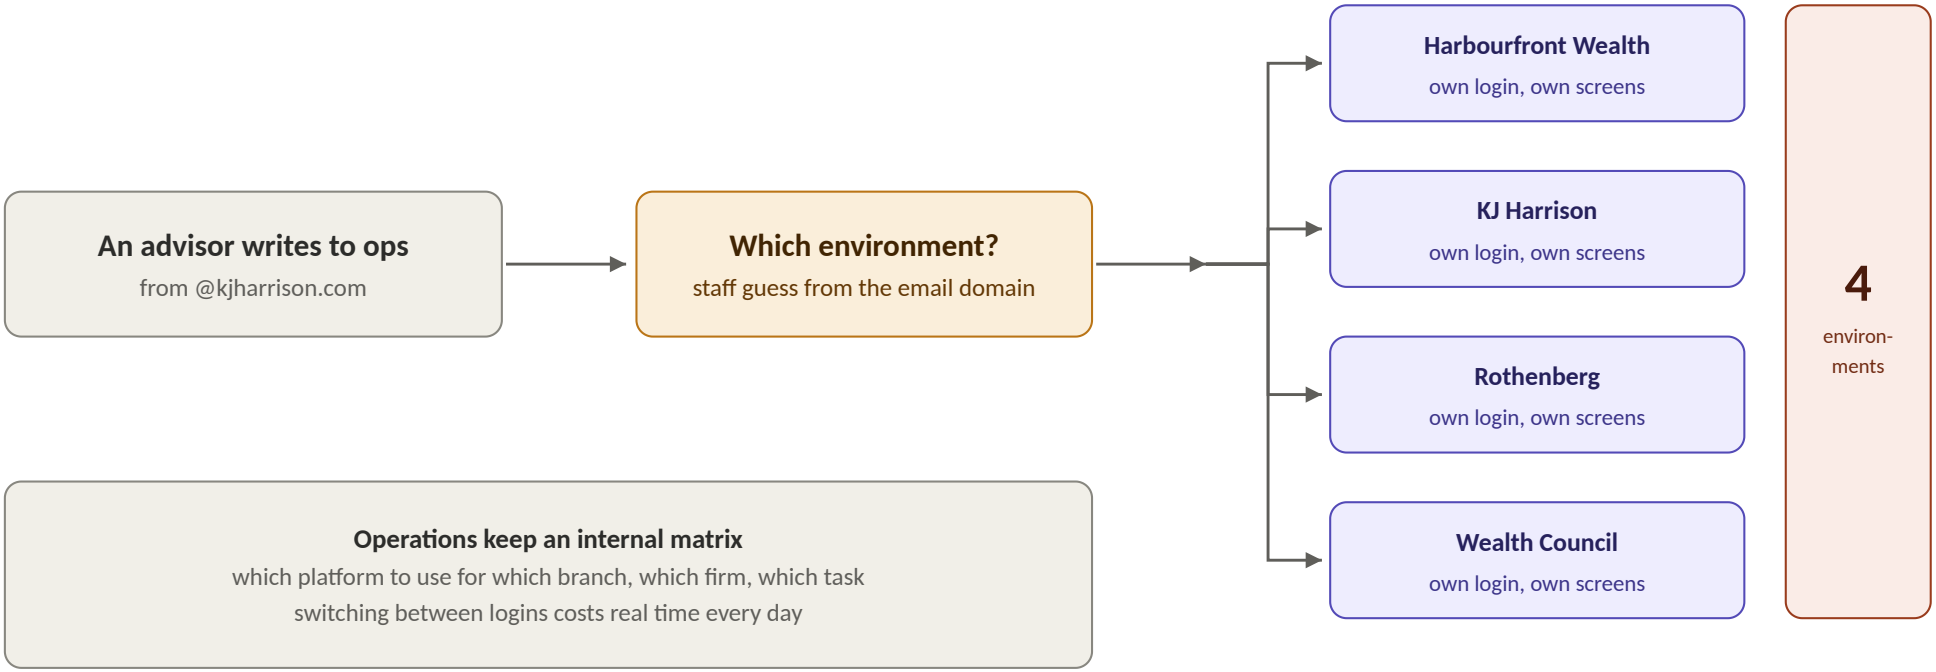

Cumberland folded under Harbourfront
every Cumberland person recreated

Underlying mechanism
an identity is welded to one firm; created in the wrong one, it is abandoned and recreated (john.doe → john.doe1)
inside a group, transfers, promotions and mergers all hit this

Switching all day

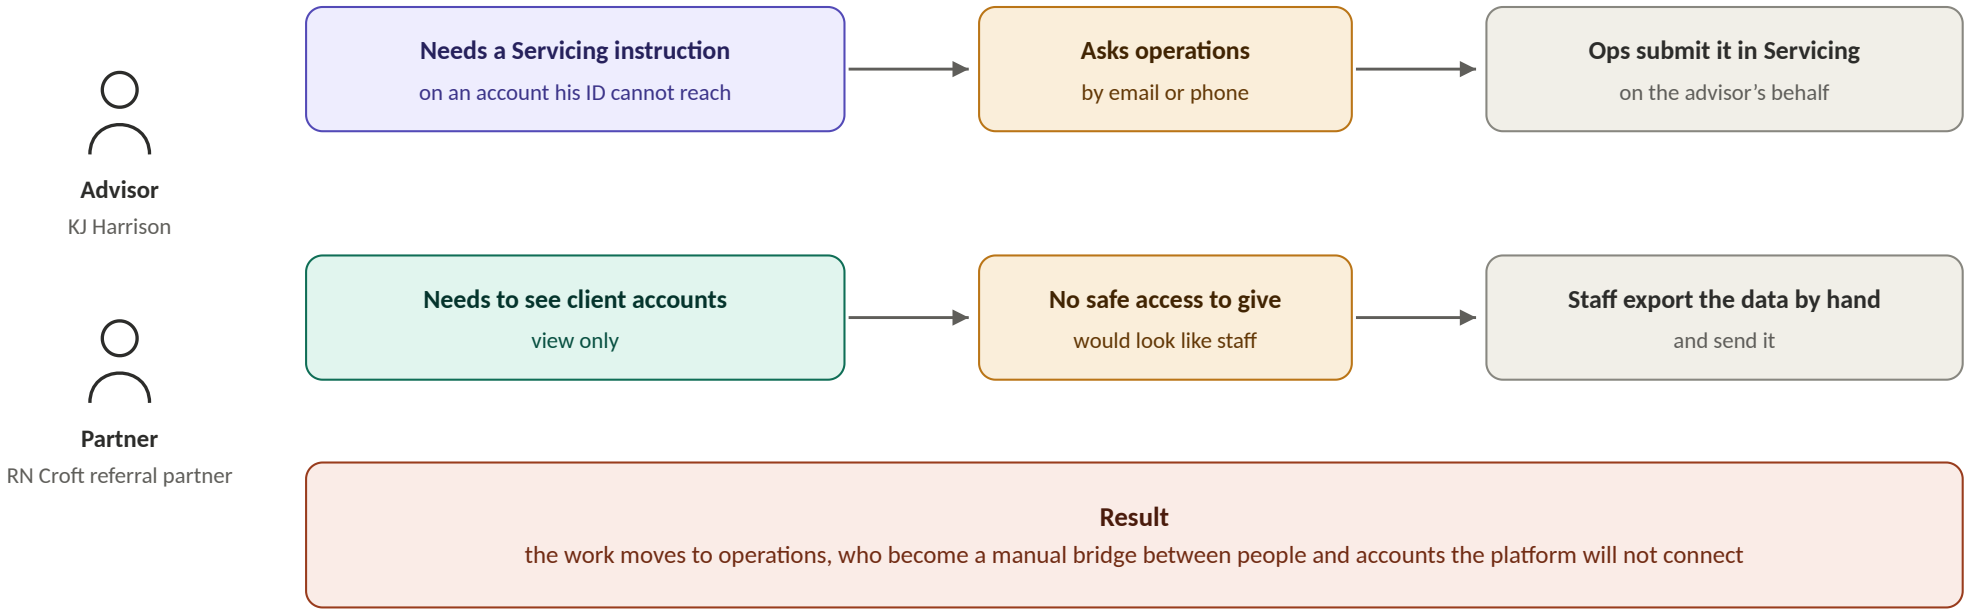

With a login per firm, people navigate by clues — the advisor's email domain, an internal matrix — and lose time to switching.

Operations do the advisors' work

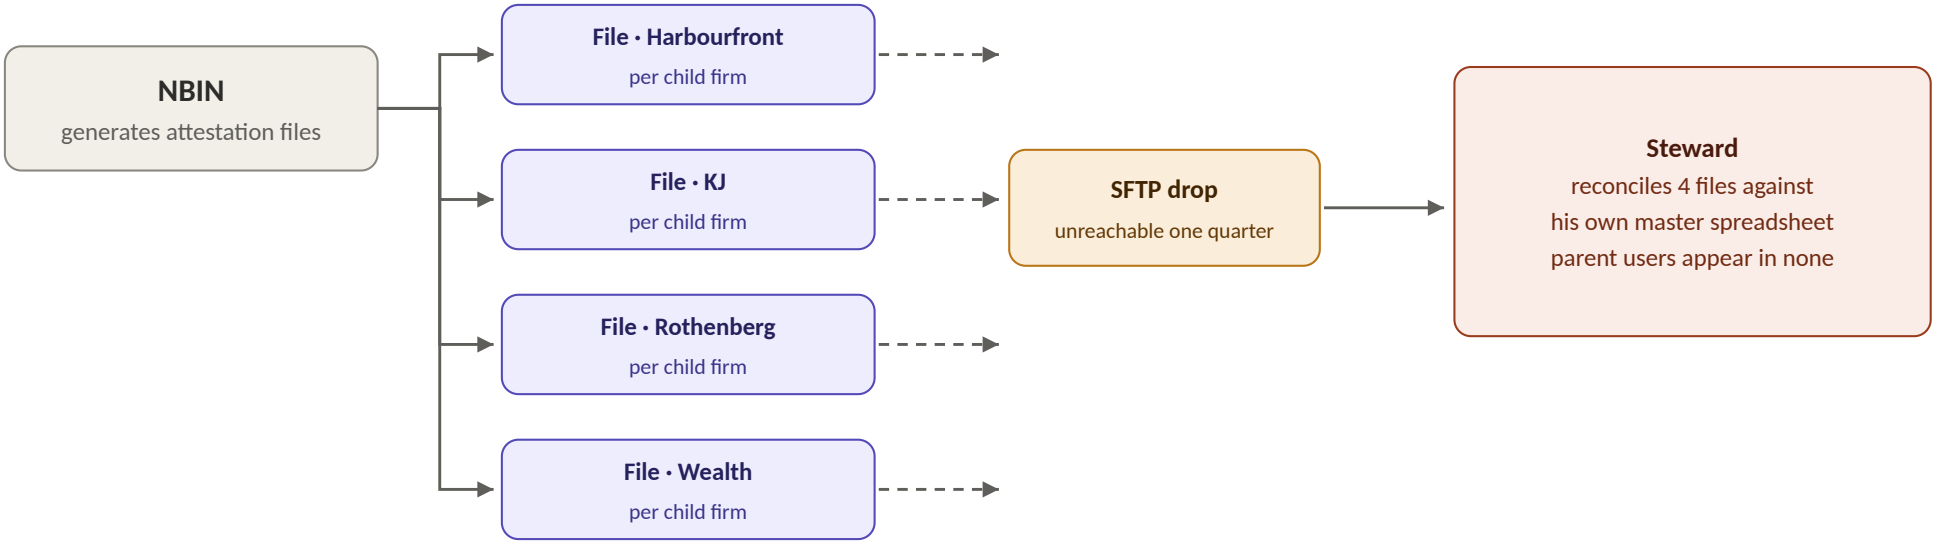

When the right identity does not reach the right accounts, somebody in operations does the task instead.

Source: Harbourfront discovery; RN Croft discovery

Attestation is a reconciliation chore

The firm receives one file per child firm and matches them to its own records by hand; parent users and delegations are not tagged.

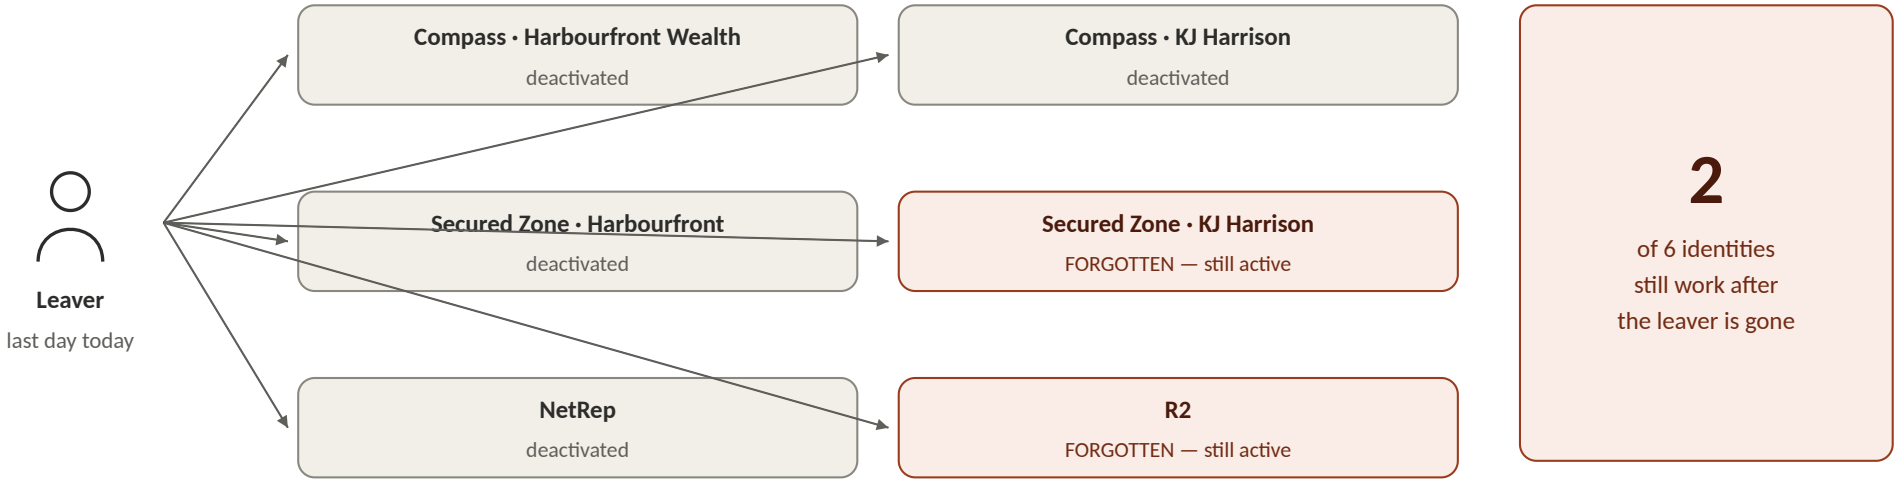

Aaron is in all four files as four different people; nothing says they are one. Guardian cannot tell which report arrived.

Source: Harbourfront discovery (Aaron's master list, SFTP); Guardian discovery; Current State Aggregation

Offboarding leaks

Removing a person means remembering every identity they had. The forgotten ones keep working.

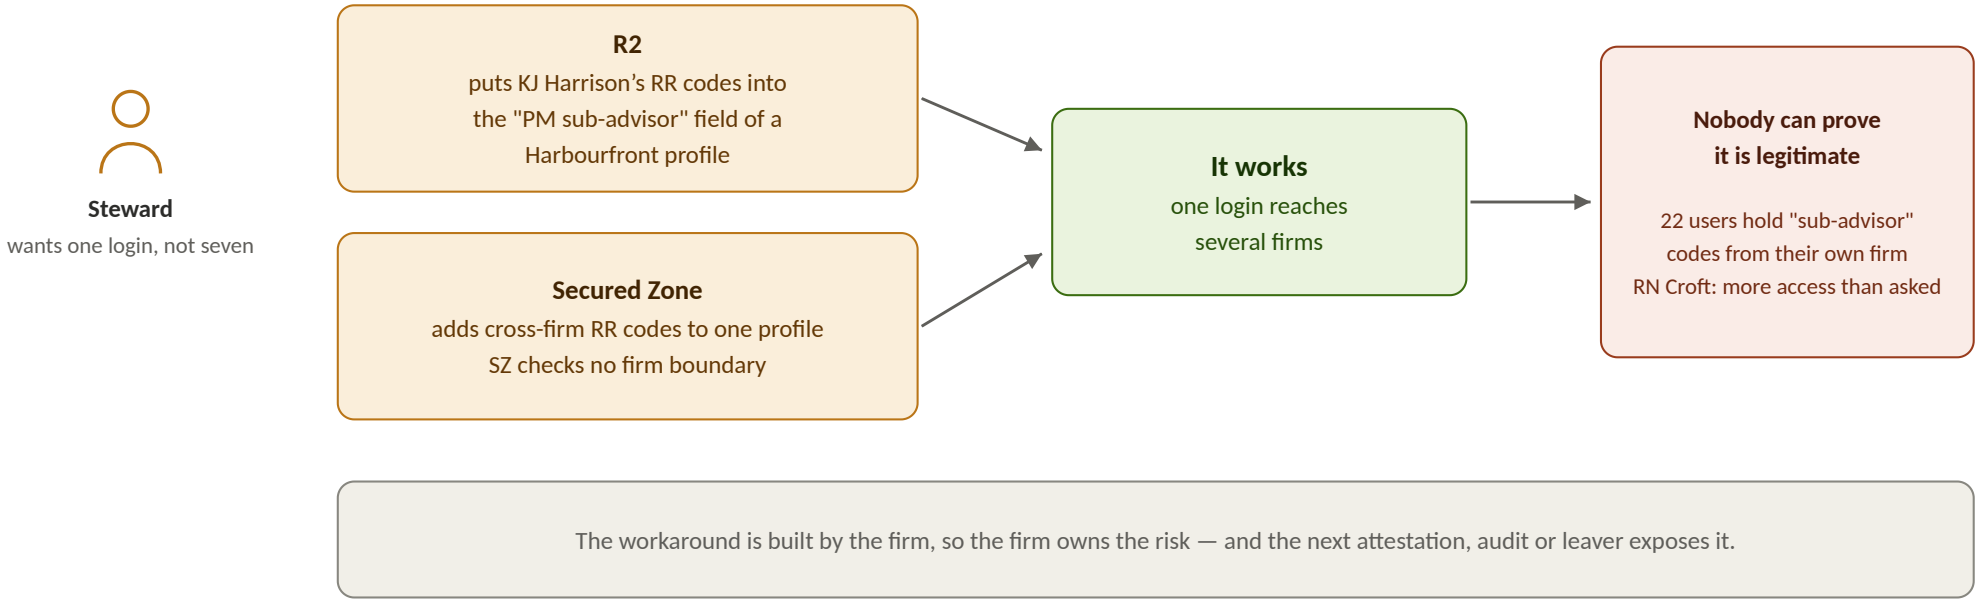

Nothing links the six, so nothing removes them together. They resurface at the next attestation — Fiera: two cycles later; RN Croft: at the quarterly review.

Workarounds the firms end up owning

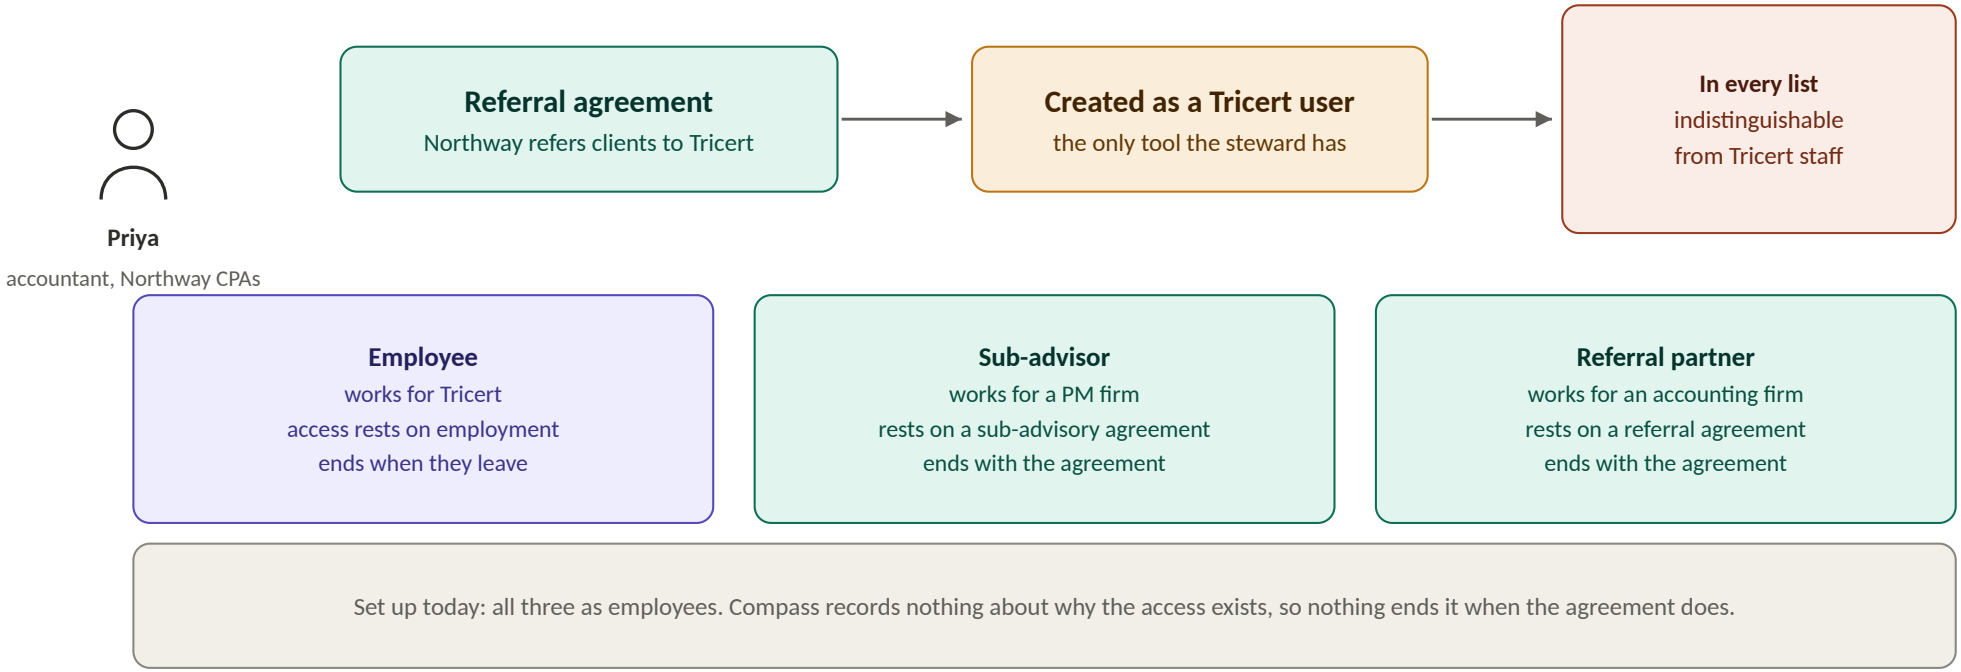

To avoid more identities, firms put another firm’s RR codes on an existing profile. It works — and from then on nobody can prove the access is legitimate.

Partners look like staff

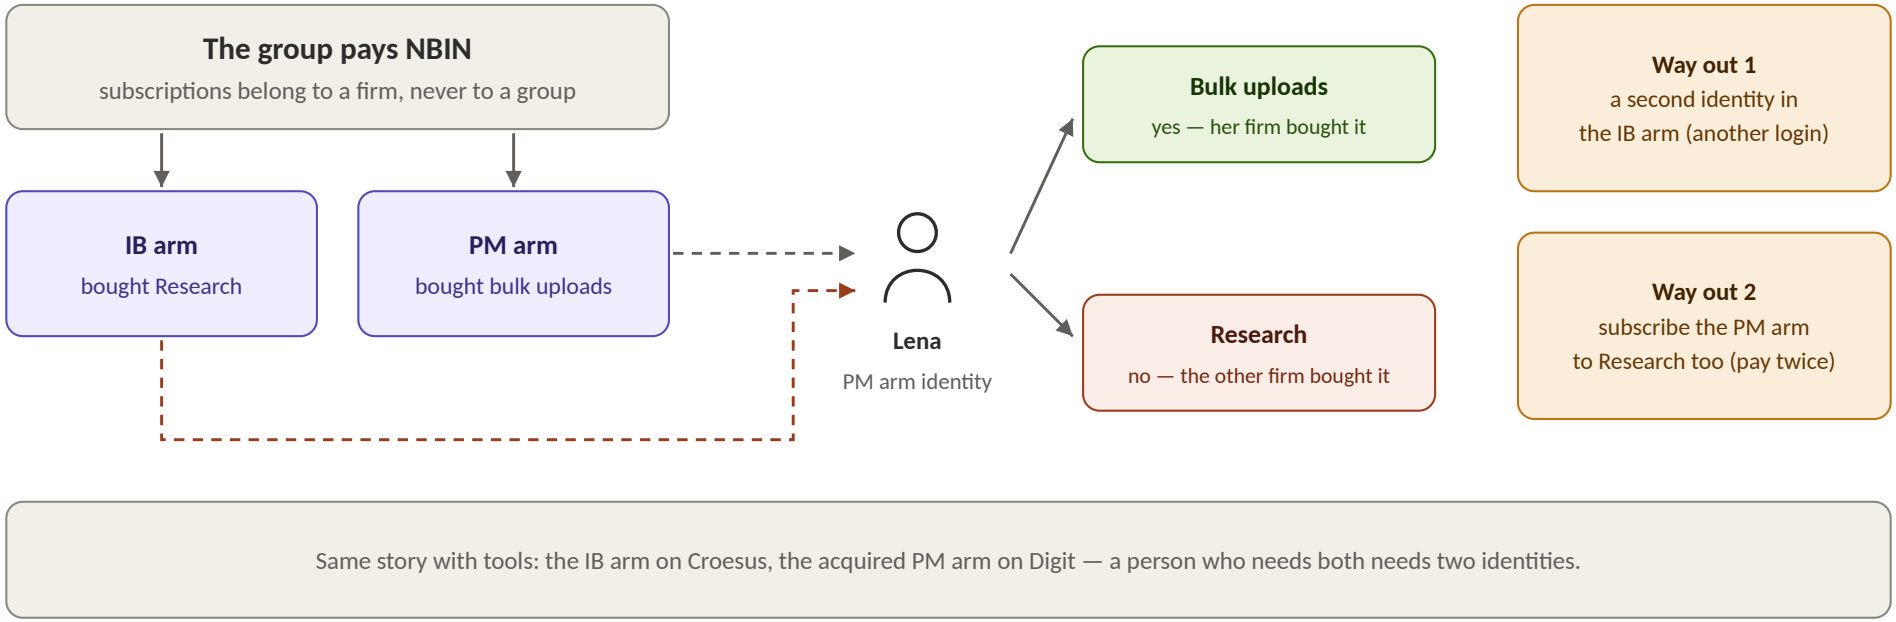

Outside partners who need to see client accounts are created as employees — external, not temporary, and invisible as what they are.

Source: Tricert discussion (Penny, Ed); RVP review; data analysis; RN Croft discovery

Buying a feature in the wrong place

The group pays for a feature once, but a person can only reach it from inside the firm that bought it.

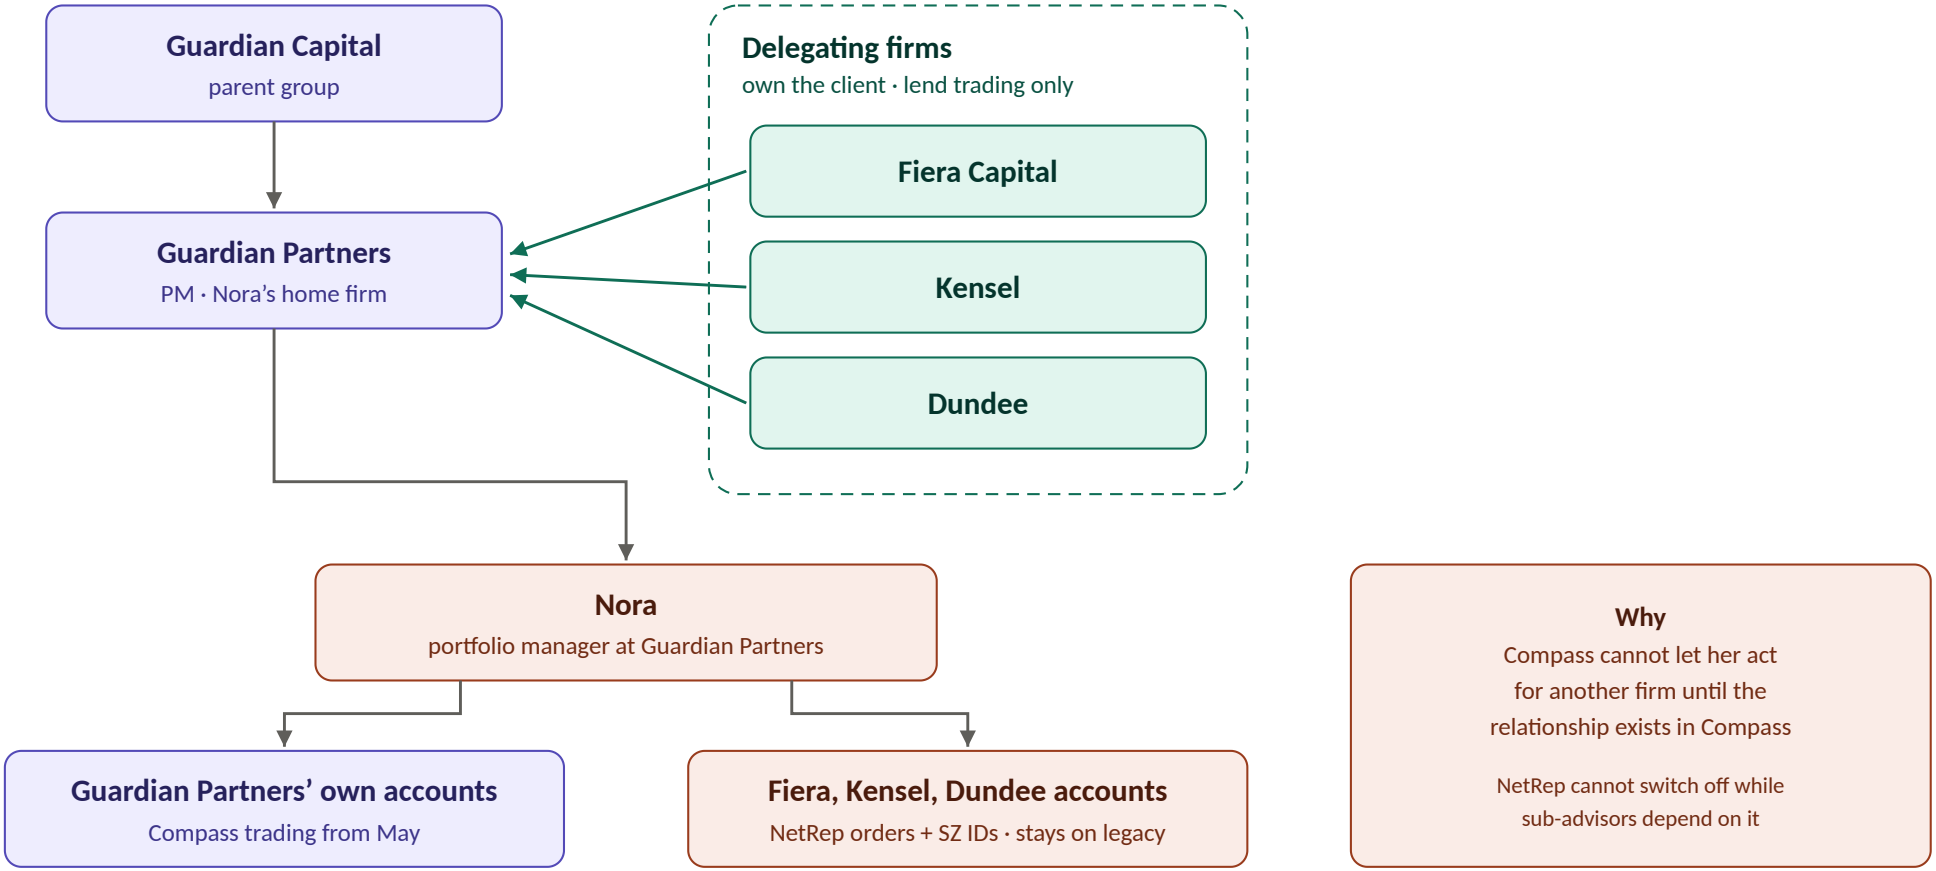

Same story with tools: the IB arm on Croesus, the acquired PM arm on Digit — a person who needs both needs two identities.

Stuck on legacy for trading

Sub-advisors are the last people on the old trading system, and they cannot leave it until Compass can let them act for another firm.
