Multi-firm + light UAR

Compass X design brainstorm - annotated screens, flow and open decisions

Internal working document for design, architecture, operations and business reviews. Everything here is a proposal to react to, not a specification. Firm names, people, IDs and RR codes are sample data; Harbourview Wealth Group stands in for a real parent group.

October 22, 2026 - Platform management, Firm and User Management

What this proposes, in one page

The idea

Keep today's architecture (27 packages, the matrix, ID Admin provisioning by hand, Secured Zone IDs, R2 IDs) and add two things: a parent group that a Compass user can belong to, and one request form inside Compass that carries firm context. No feature registry, no system integration layer, no automated provisioning. Sub-advisory access follows with trading.

Why

Multi-firm firms cannot launch without a way to request access under the new model (Candi, Radhika). The registry and system integration were the largest part of the six-month estimate and are not needed to request or provision a parent group user. Everything else is form, status and checklist work on top of screens and tools that already exist.

In scope for v1

Parent group firm type and child-firm list - request form (create, update, deactivate) with firm scope, package-first access, RR codes per firm, system checkboxes - steward status page - ID Admin queue with Firm360 check and matrix-linked checklist - one-time credential - retire-after-first-sign-in - one row per person in the steward's user list.

Out of scope for v1

Feature registry, system integration registry, machine-generated instructions, automated provisioning, sub-advisory access (phase 2 with trading), self-serve user management, attestation, R2 decommission slice (second half of 2027).

How to read the screen pages	
1	Red numbered badge on a screen - explained under Callouts on the same page
	New here - not in Compass today
	Decision needed - needs an owner before build
	Unchanged today - a tool or process kept as is
	Pages 4 to 9 are the screens, 10 to 12 the sequence, 13 and 14 the changes and decisions.

Screen	Who	Page
A - New access request (two pages)	Group steward	4, 5
B - Users across the group	Group steward	6
C - Access requests and status	Group steward	7
D - Process request	ID Admin (SAA)	8
E - Parent group firm settings	Product Activation	9

Who does what, and on which screen

One parent group user, from setup to first sign-in. Letters refer to the screen pages.

	0 - Setup (once per group)	1 - Request	2 - Fulfil	3 - Sign in and retire
Product Activation	Creates the parent group firm, assigns the global parent package, records the group steward (E)	-	-	-
Group steward	Signs the steward form	Fills the form: person, firm scope, package, RR codes, systems; submits (A). Tracks status (C)	Answers 'needs info' if asked; reveals the temporary password once (C)	Shares the password in person; sees one row per person in Users (B)
ID Admin (SAA)	-	Receives the queue item (D)	Checks Firm360, provisions Compass from the matrix row, links the SZ ID, raises NetRep if asked, ticks the checklist (D)	Deactivates the old IDs with the bulk tool after first sign-in; marks complete (D)
The user	-	-	Receives the temporary password from the steward	Signs in with one ID; sees Accounts, Orders and Servicing across the group
Systems	Firm360 nightly feed carries Parent_Code and child firms	Compass validates against firm data already synced	Secured Zone Security App and the NetRep form, as today	Okta first-login event unblocks the retire step

The one sentence for the room: the steward tells Compass which firms the person works across, ID Admin provisions it the way they do today, and Compass keeps the record.

Screen A · New access request (1 of 2)

Firm settings > Access requests > New request - sections 1 to 3

Group steward

What you are looking at

The steward's single form for Compass, Secured Zone and NetRep access. The top half asks who the person is, which firms they work across, and which package they need.

Callouts

1	Create, update and deactivate in one form. v1 can ship create-first if needed.
2	Duplicate-ID lookup by email at intake. It tells the steward which IDs will be retired.
3	Firm scope: single firm, parent group, or sub-advisory - greyed out until trading.
4	Child firms come from Firm360 with the parent code shown. A missing firm is a Firm360 fix, not a form fix.
5	Package first - the same packages ID Admin provisions today. No a la carte menu.
6	Options that cannot apply are locked with the reason, so an invalid combination is never submitted.
11	The structured record ID Admin receives, exactly as it appears in their queue.
12	What happens next and the two-business-day target, stated up front.

New here: The form itself; firm scope as a first-class field; the duplicate check; locked invalid options.

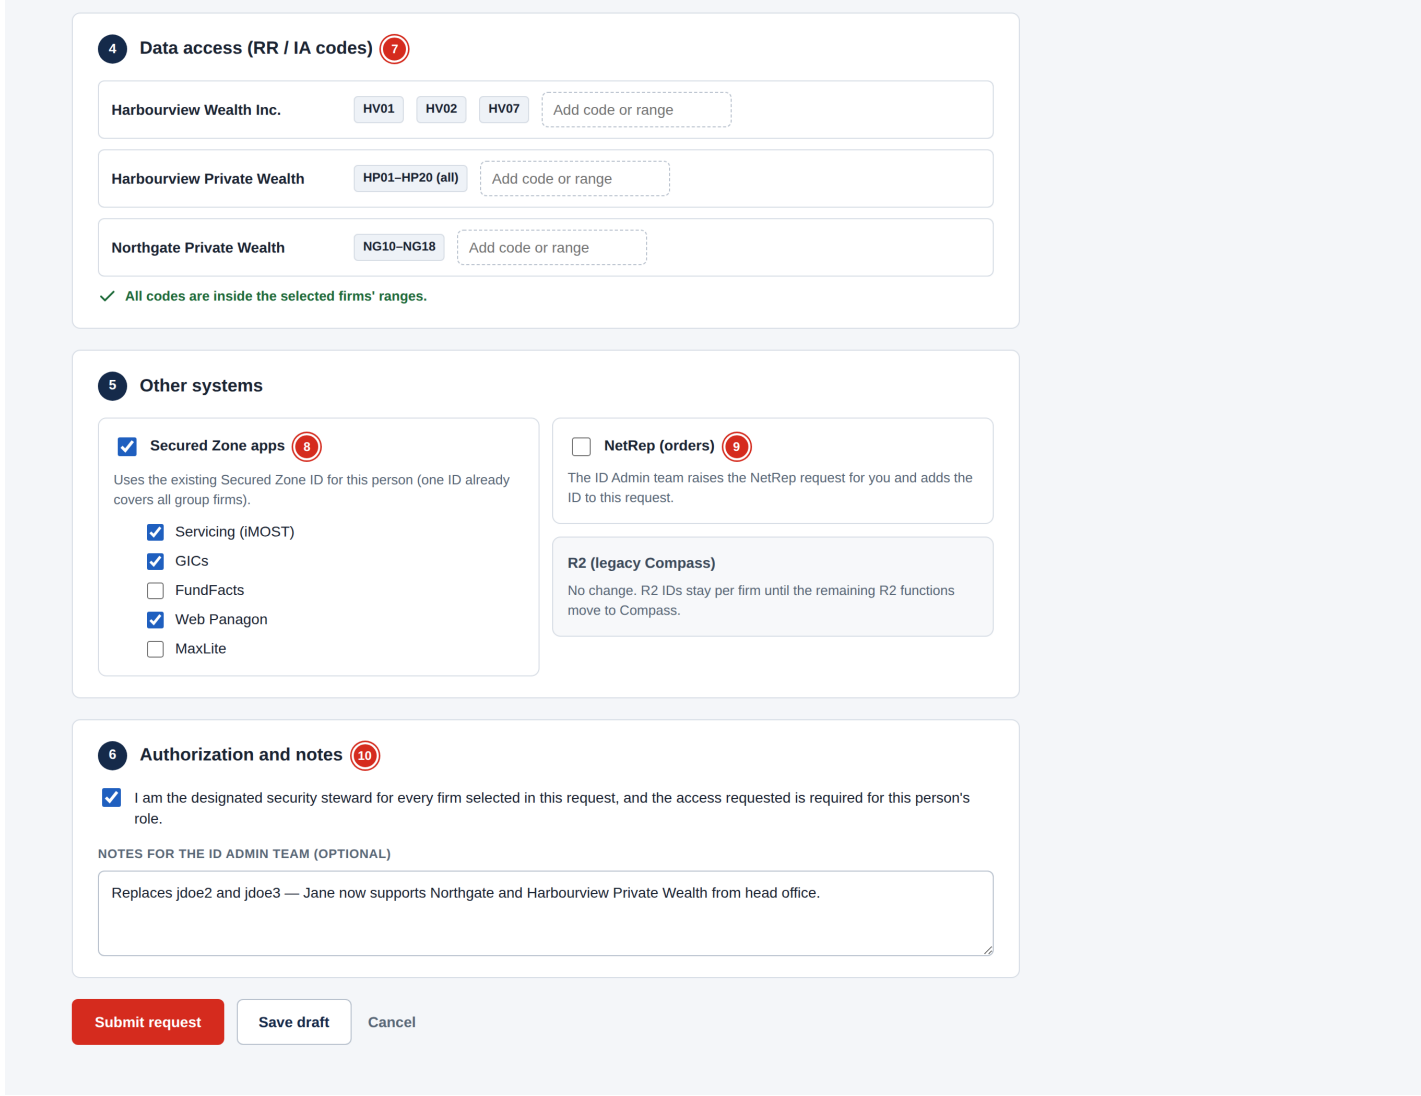

Decision needed: Does the steward see package names, or business-level choices that ID Admin maps to a package? Does parent group scope mean picking child firms, or always all children?

Unchanged today: The 27 packages, the matrix, ID Admin provisioning by hand.

Screen A · New access request (2 of 2)

Firm settings > Access requests > New request - sections 4 to 6

Group steward

What you are looking at

The lower half carries data scope and the other systems. The validation line under the RR codes is the one rule change multi-firm needs on the platform.

Callouts

7	RR / IA codes per firm, checked against the union of the selected firms' ranges. Today a code must sit inside one firm.
8	Secured Zone apps reuse the person's existing SZ ID. Nothing is decoupled or re-created.
9	NetRep is a checkbox that ID Admin actions on today's form. R2 says 'no change' on purpose.
10	Attestation and notes replace the signature on the paper form for this request type.

New here: RR validation across child firms; the Submit action creating a tracked request record.

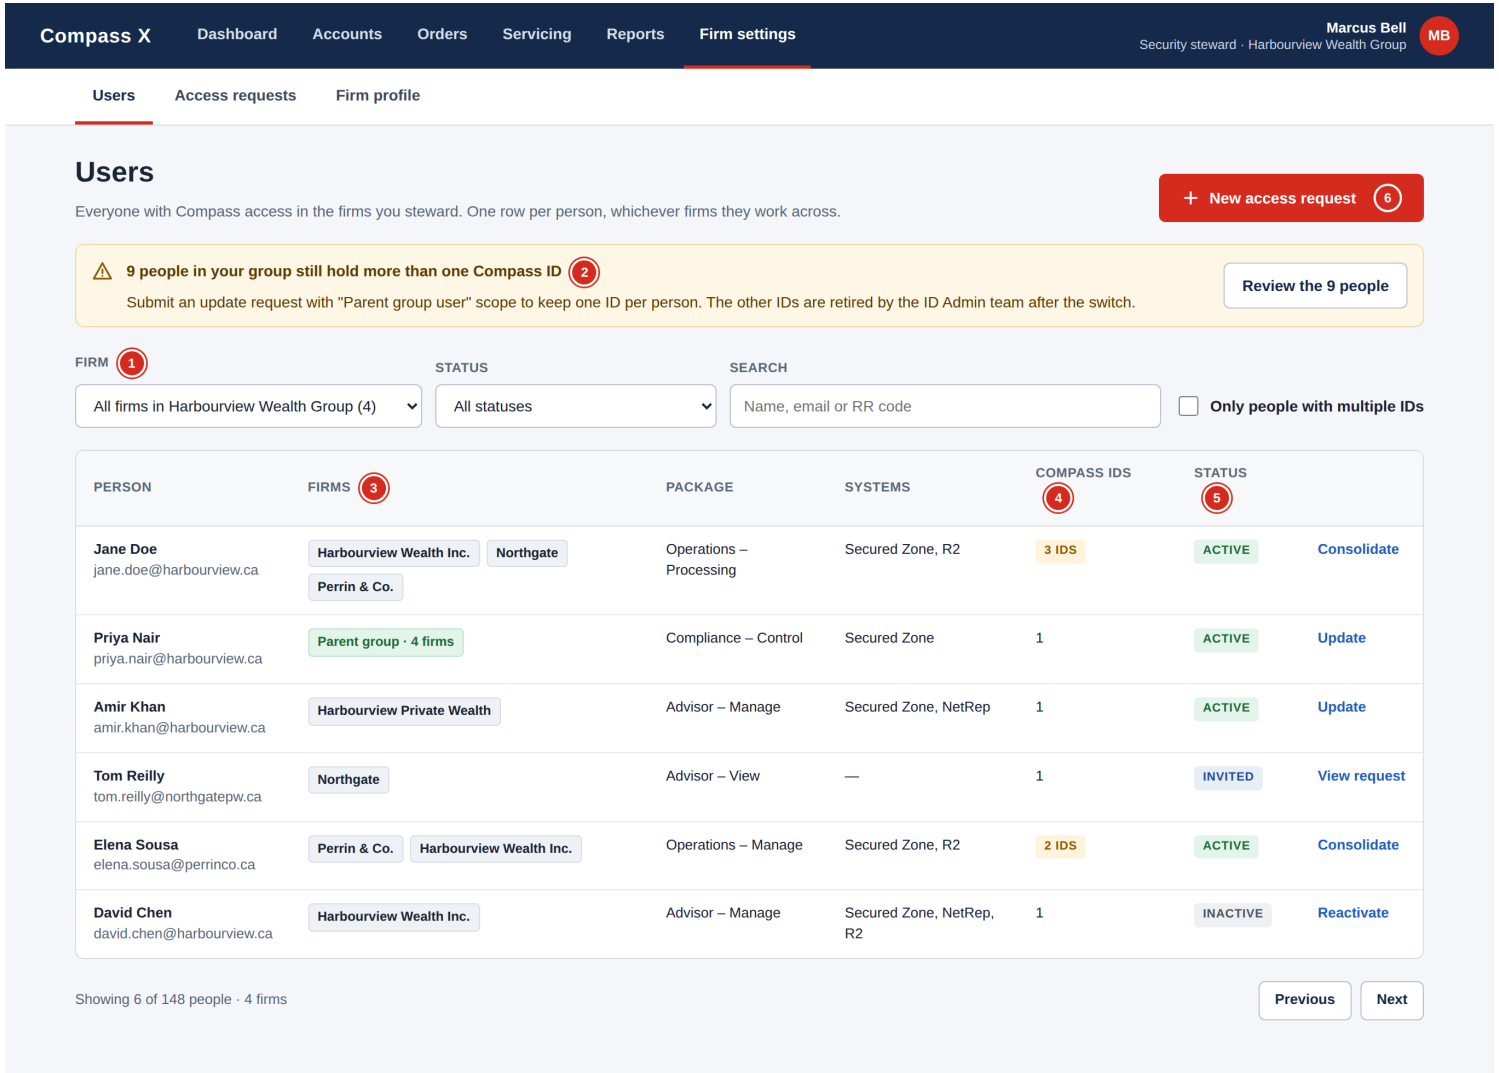

Decision needed: Secured Zone apps and NetRep inside the v1 form, or left on today's forms as Penny descoped? RR codes typed by the steward, or picked from Firm360 ranges?

Unchanged today: Security App profiles, the NetRep form, R2 IDs per firm.

Screen B · Users across the group

Firm settings > Users - filtered to all firms in the group

Group steward

What you are looking at

One row per person across the whole group. Today a steward sees one firm's users per ID, so the same person appears several times under different logins.

Callouts

1	Firm filter: the whole group or one child firm.
2	Consolidation banner: how many people still hold several IDs, with one click to start the update request.
3	Firms column: chips show which child firms the person works across; 'Parent group' marks a group user.
4	Compass IDs column flags the cleanup backlog. The target is one everywhere.
5	Status pills are today's lifecycle: Active, Invited, Inactive.
6	New access request is the only way in. There is no catalog screen behind it.

New here: Group-wide view keyed by person; multiple-ID flag; consolidation entry point.

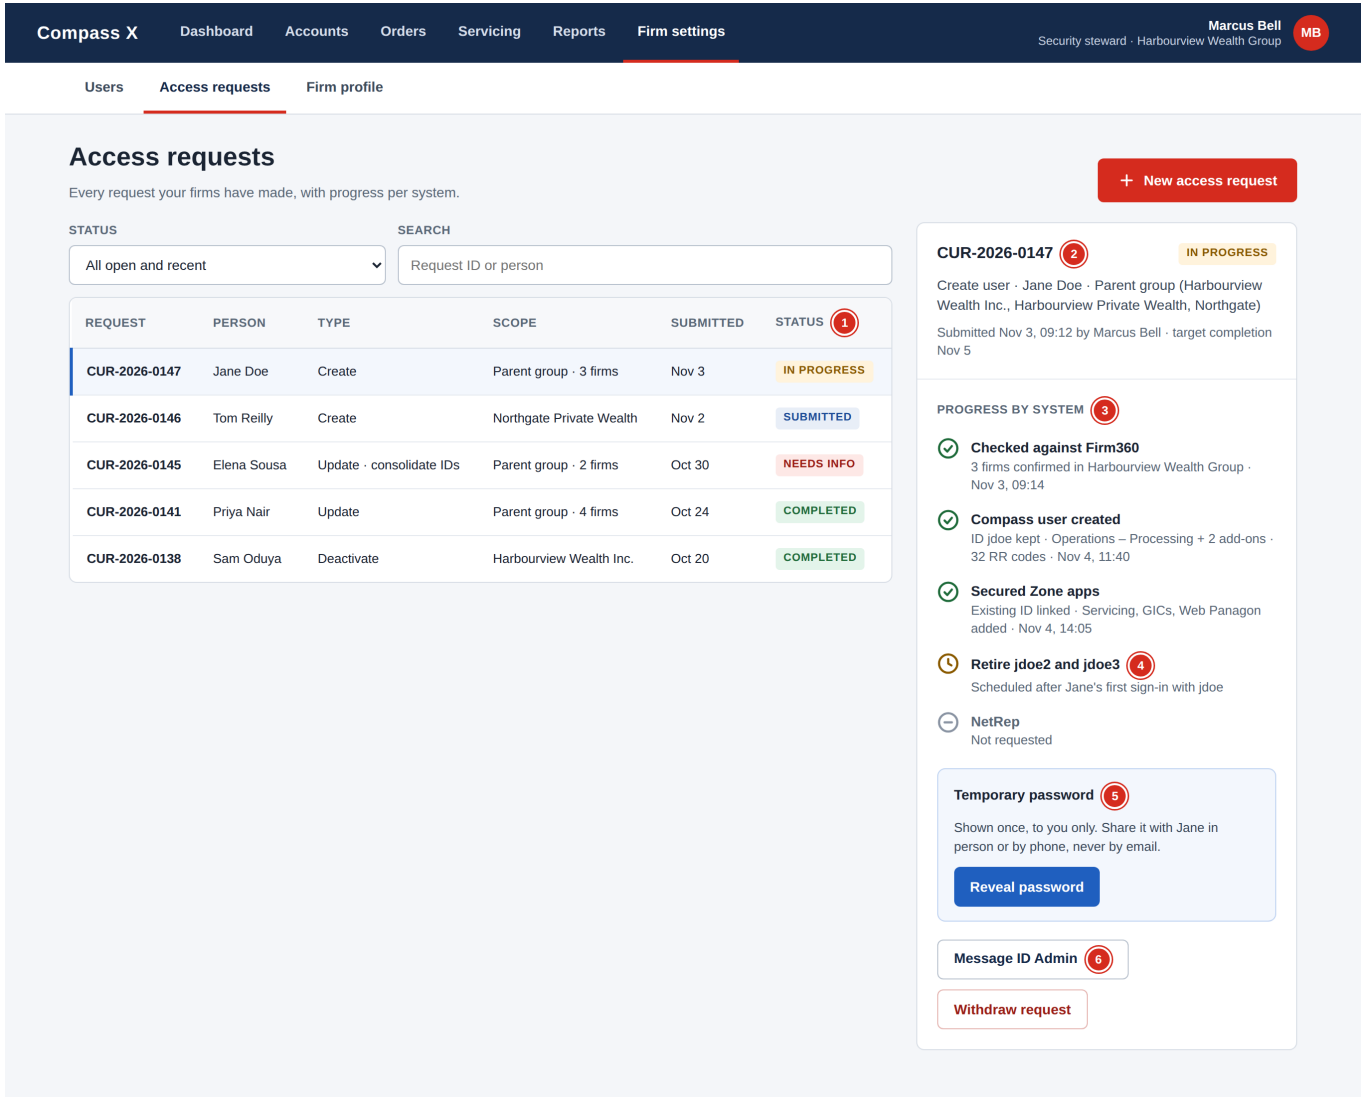

Decision needed: Should 'Consolidate' pre-fill the update request with the person's existing IDs, firms and RR codes?

Unchanged today: User statuses, deactivate-as-freeze semantics, user admin screens.

Screen C · Access requests and status

Firm settings > Access requests - list with the detail panel open

Group steward

What you are looking at

Every request the group has made, with progress per system. The detail panel is the same record ID Admin works from, so both sides see one truth.

Callouts

1	Status lifecycle: Submitted, In progress, Needs info, Completed. Visible without asking anyone.
2	Request detail with scope and target date.
3	Progress per system: Firm360 check, Compass, Secured Zone, NetRep if requested.
4	Old IDs are retired only after the kept ID has been used.
5	Temporary password revealed once, inside the request, never emailed.
6	Message ID Admin and withdraw, so questions stay attached to the request.

New here: Request as a tracked object; per-system progress; retire-after-first-sign-in rule; one-time credential.

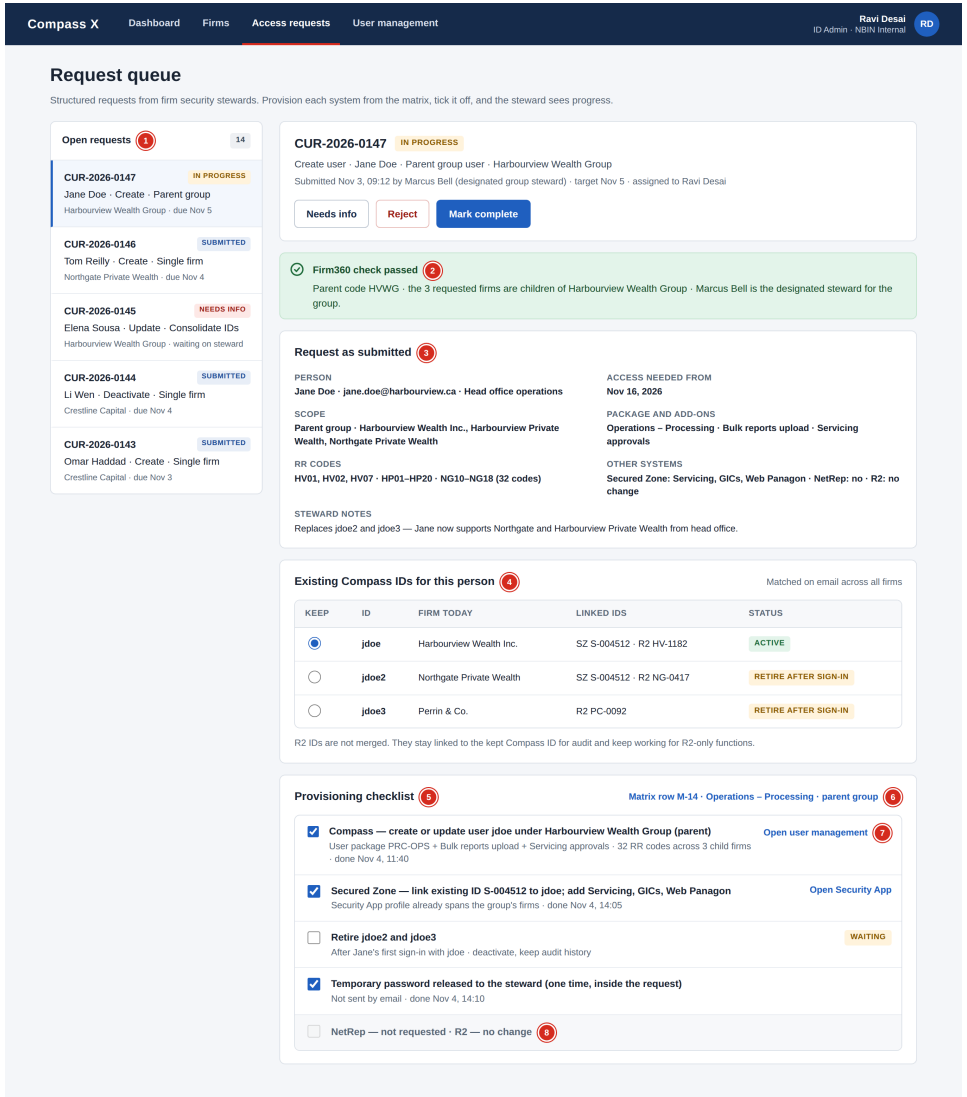

Decision needed: Is the one-time credential in v1, or does today's phone and email channel stay for now?

Unchanged today: Password policy, Okta, the ID Admin team doing the work.

Screen D · Process request

Access requests > queue - request CUR-2026-0147 open

ID Admin (SAA)

What you are looking at

The ID Admin view. Structured intake replaces email and forms, the matrix stays the instruction source, and the actual provisioning still happens in today's screens.

Callouts

1	Queue with due dates replaces email and form intake.
2	Firm360 check: group membership and steward designation confirmed before work starts.
3	Request as submitted: structured fields, nothing to interpret.
4	Existing IDs: keep one, retire the rest after sign-in. R2 IDs are not merged.
5	Provisioning checklist: a tick list, not generated instructions.
6	Matrix row link opens Radhika's row for this package and scope.
7	'Open user management' is today's screen doing the real work.
8	NetRep and R2 rows: today's process, unchanged.

New here: Queue, Firm360 check, structured request, keep-one-ID step, checklist.

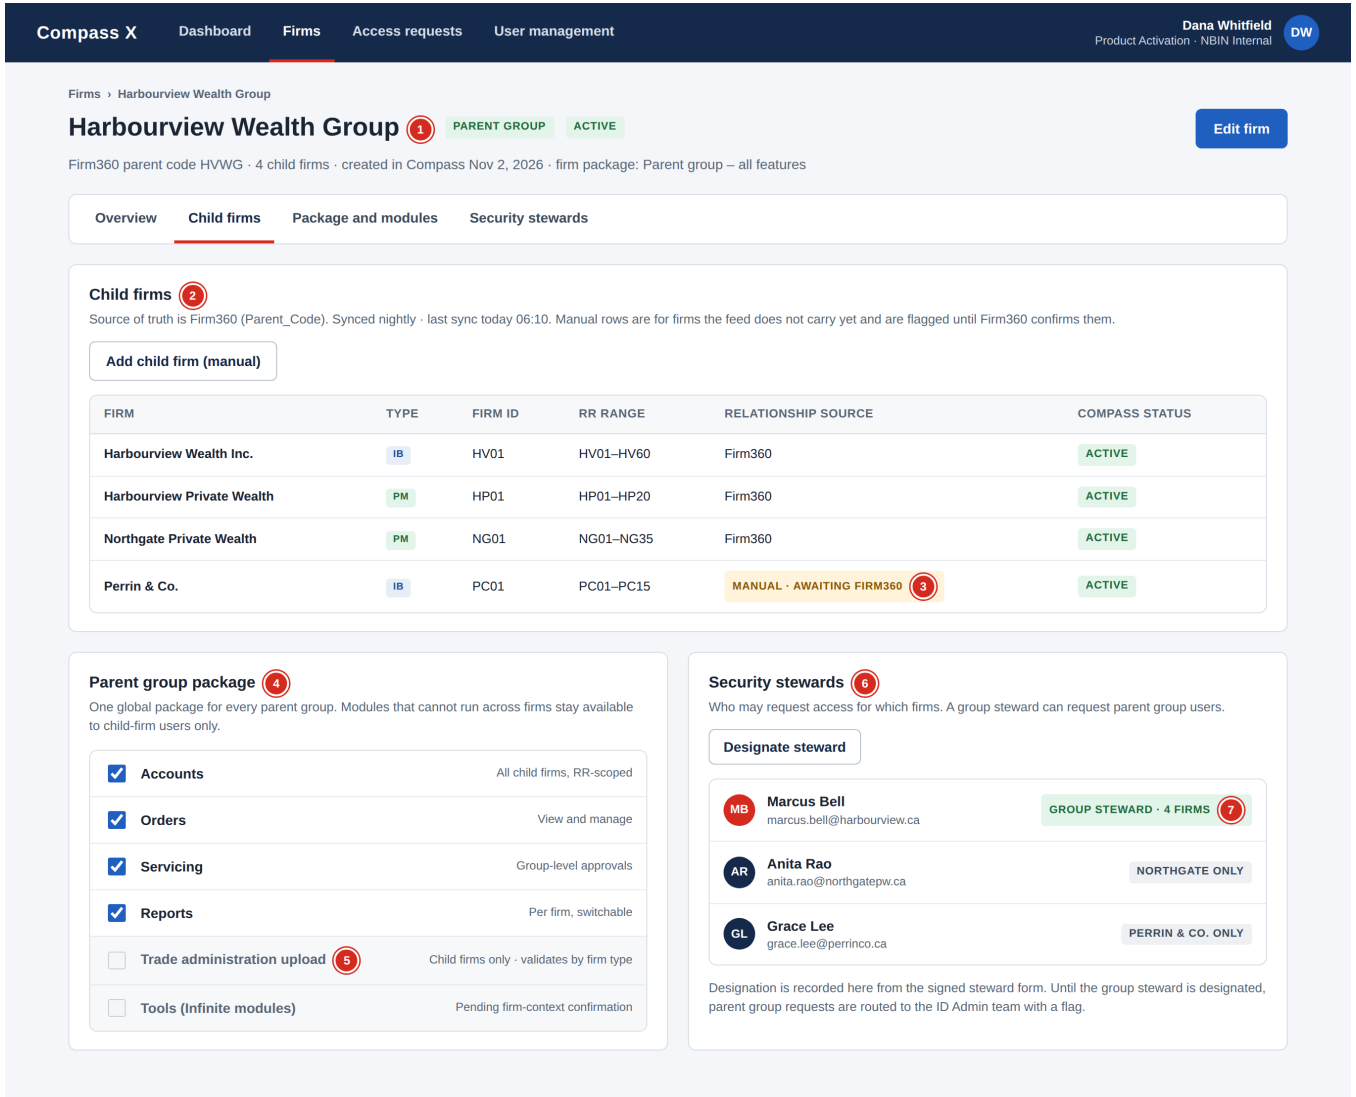

Decision needed: Does ID Admin create the user from the request (pre-filled), or by hand in user management as now? Who owns the exception path for non-standard profiles?

Unchanged today: The matrix, user management, Security App, NetRep form, bulk upload tool.

Screen E · Parent group firm settings

Firms > Harbourview Wealth Group > Child firms

Product Activation

What you are looking at

The internal setup that makes a parent group exist in Compass. This is the data the form validates against and the package a group user receives.

Callouts

1	Parent group as a firm of its own type, carrying the Firm360 parent code.
2	Child firms from the Firm360 nightly feed; the relationship never lives only in Compass.
3	A manual row is flagged until Firm360 confirms it - a pilot-only bridge while the loader is built.
4	One global parent package for every parent group.
5	Locked modules: child-firm-only features and Infinite tools pending firm-context confirmation.
6	Security stewards: who may request for which firms.
7	Group steward designation is required before parent group requests are accepted.

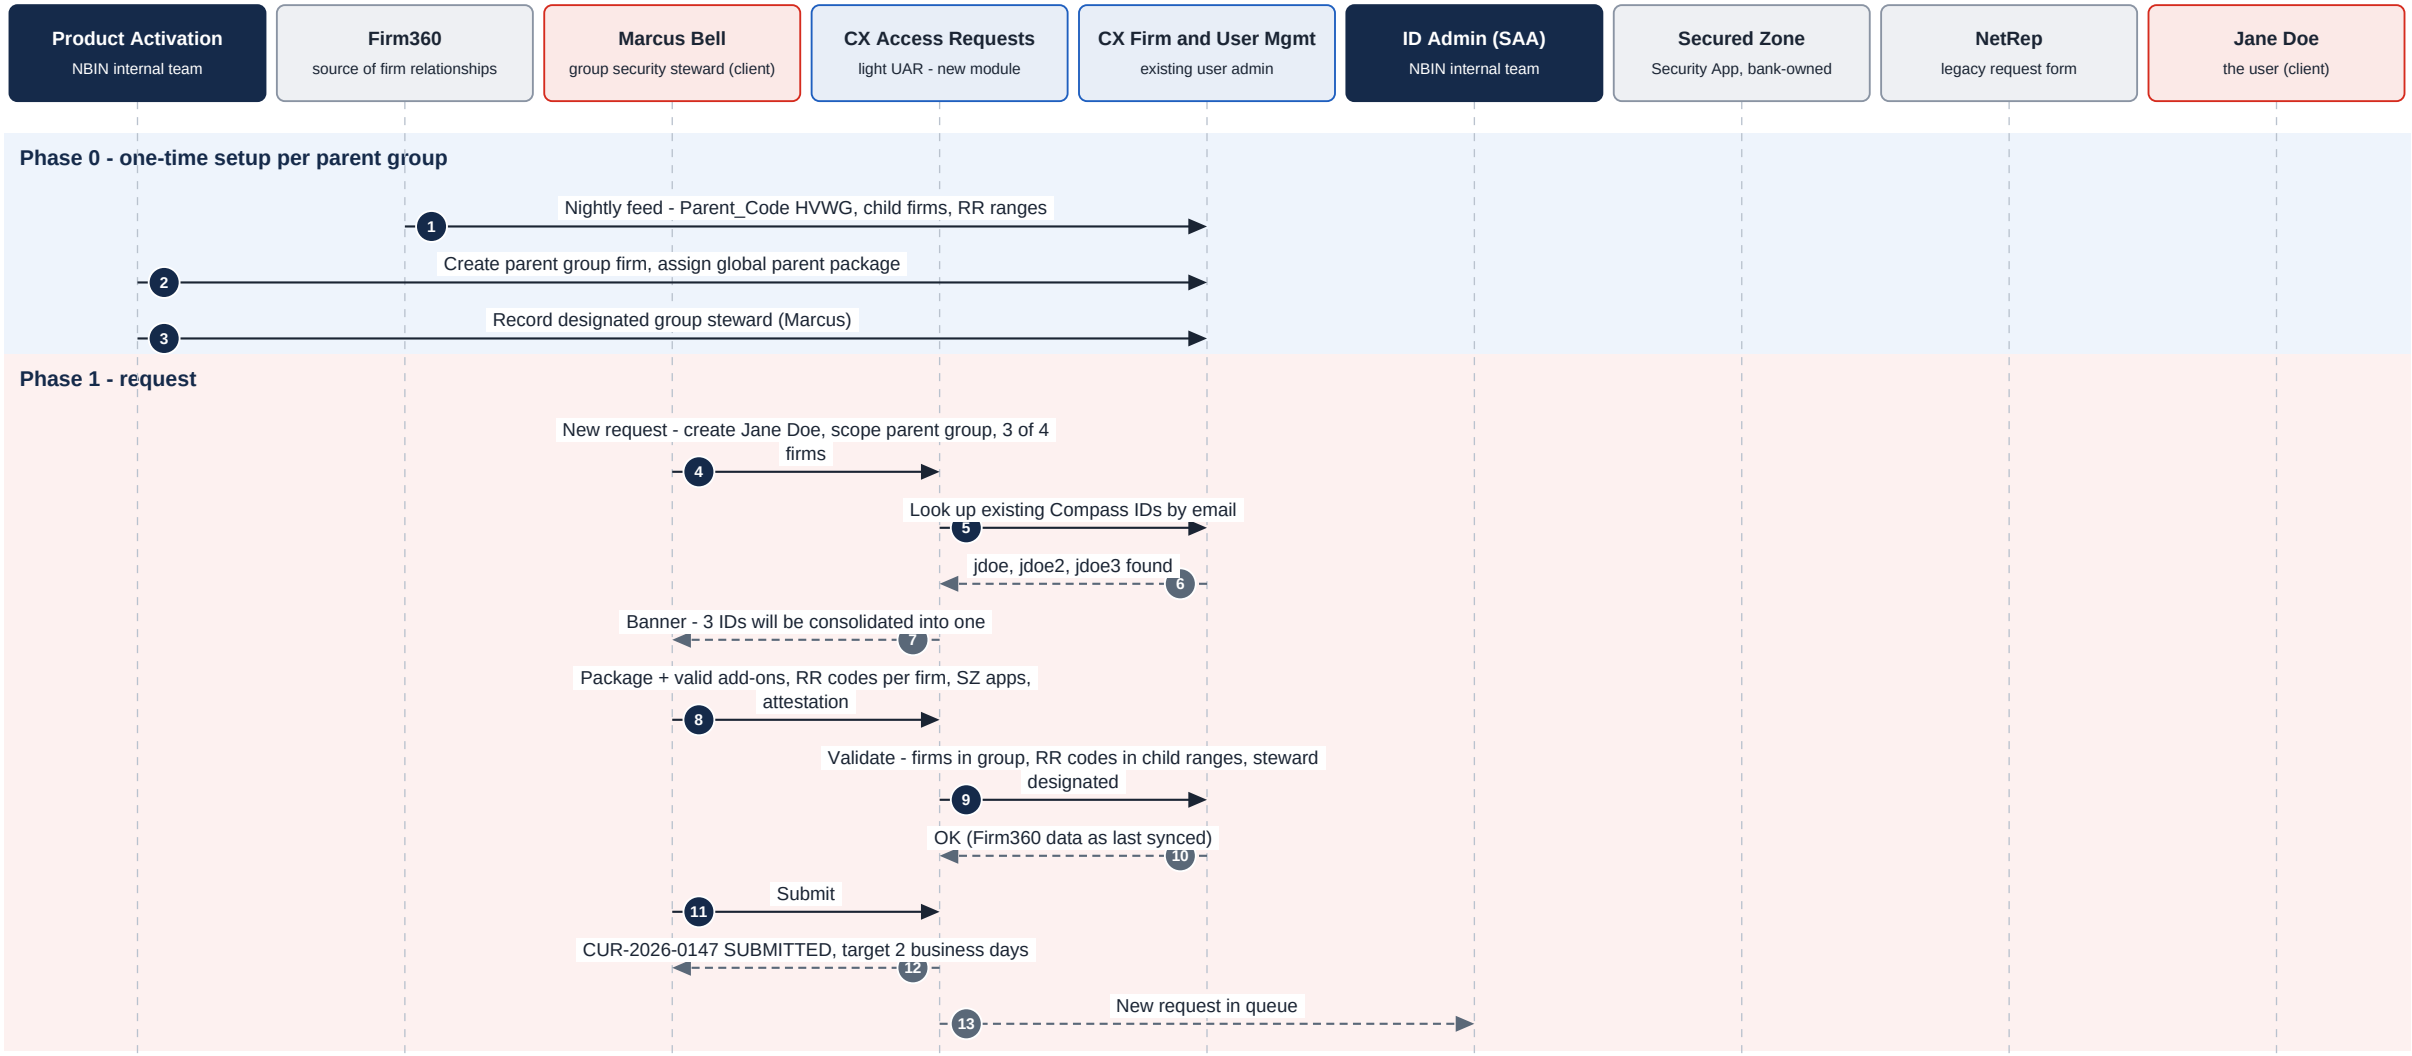

New here: Parent firm type, child-firm list, global parent package, steward designation.

Decision needed: Firm360 feed date versus manual rows for the pilot. Which modules are parent-eligible on day one. Who designates the group steward and where it is recorded.

Unchanged today: Firm packages by firm type, firm settings overrides, the nightly firm loader.

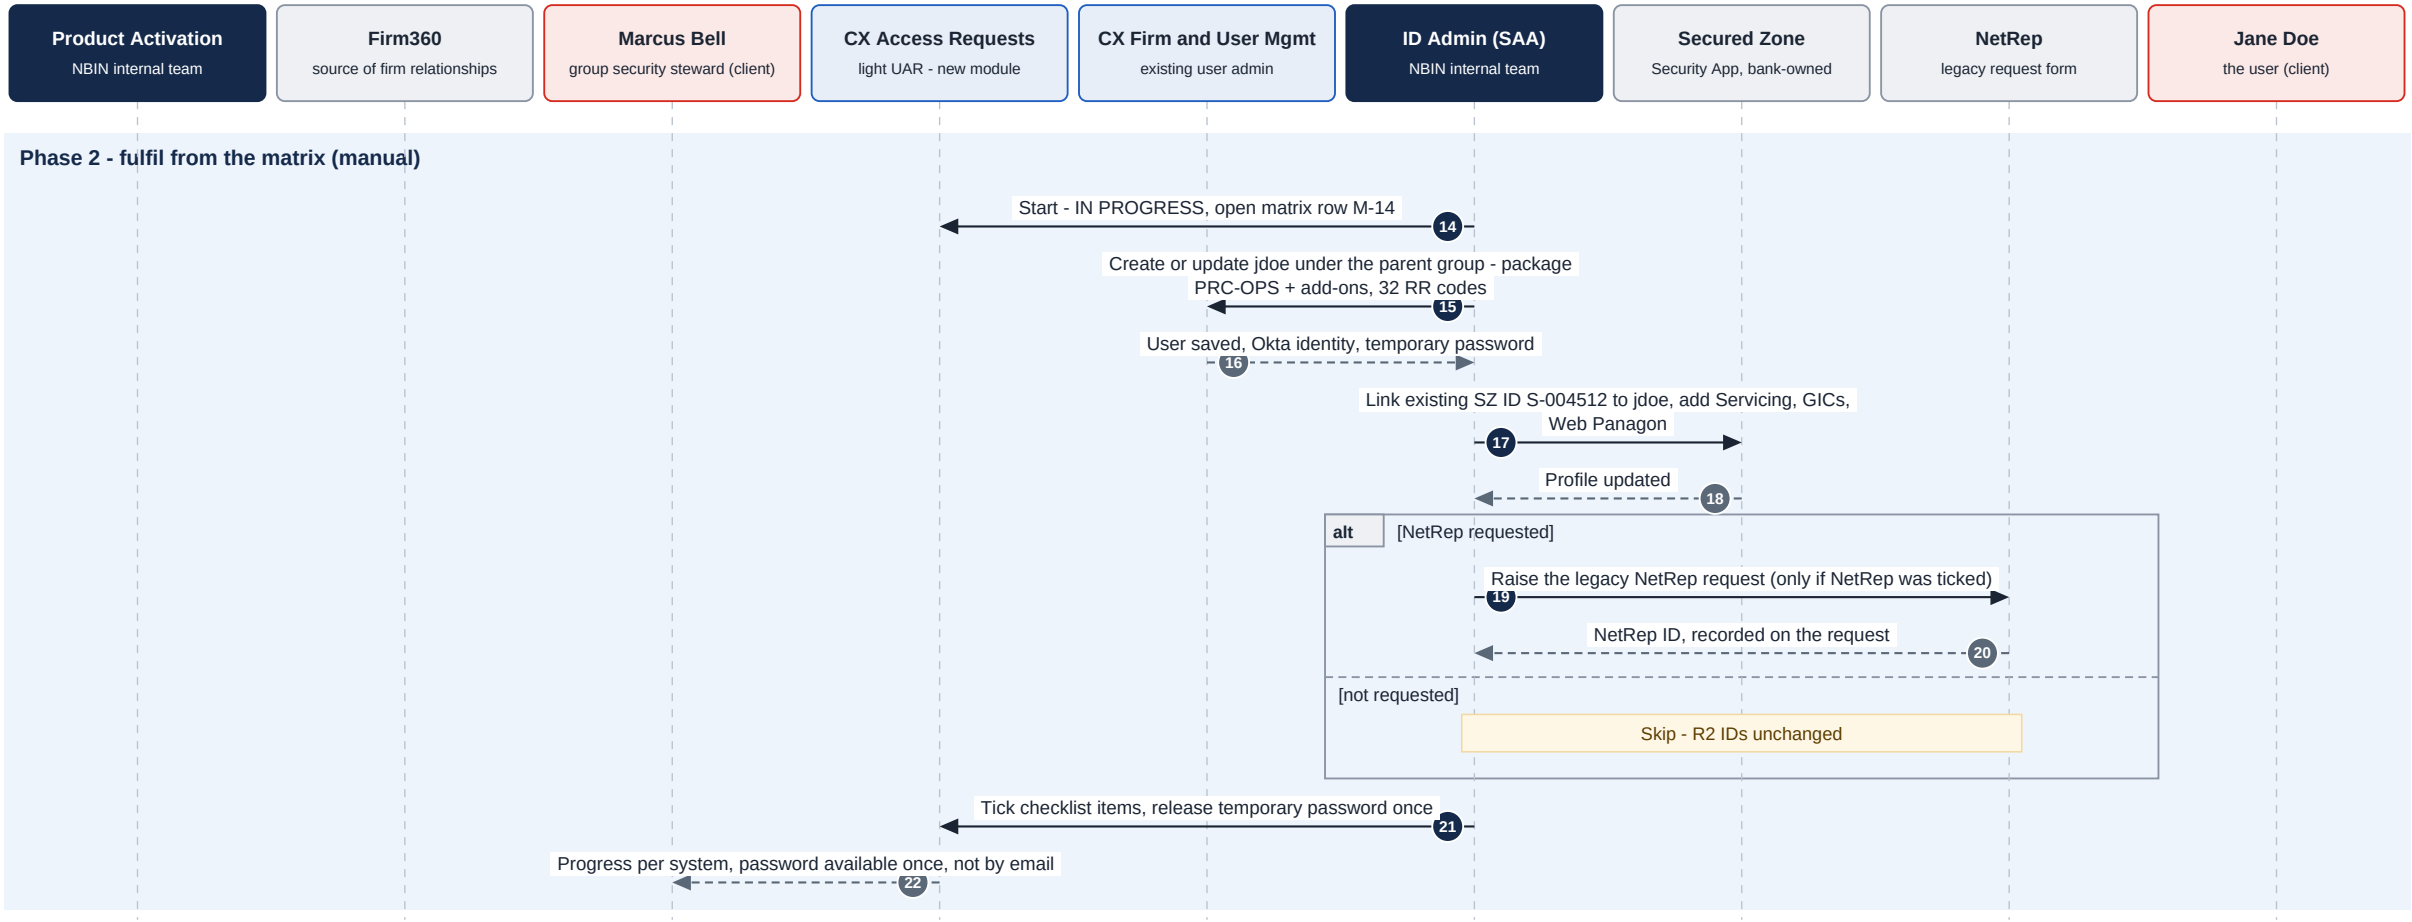

Sequence 1 of 3 - setup and request (steps 1 to 13)

Solid arrows are actions, dashed arrows are responses or status updates. Numbers match the step table in the sequence export.

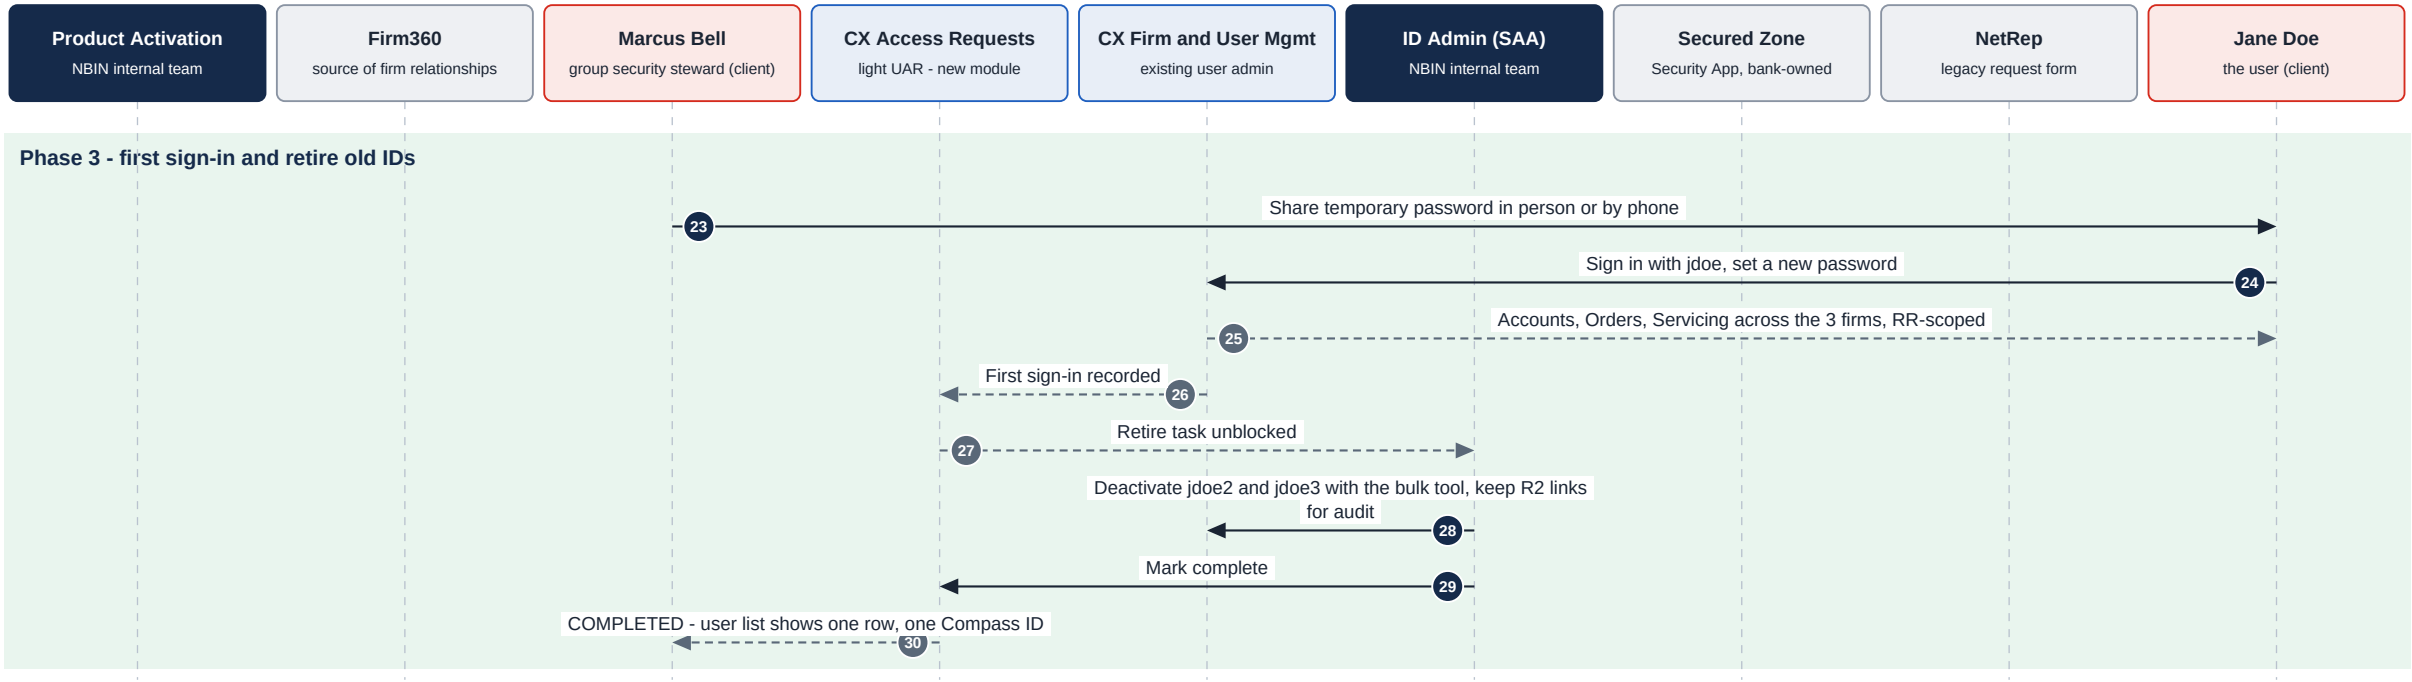

Sequence 2 of 3 - fulfil from the matrix (steps 14 to 22)

Solid arrows are actions, dashed arrows are responses or status updates. Numbers match the step table in the sequence export.

Sequence 3 of 3 - first sign-in and retire old IDs (steps 23 to 30)

Solid arrows are actions, dashed arrows are responses or status updates. Numbers match the step table in the sequence export.

What this changes on the platform, and what it leaves alone

Must change	Stays exactly as today
1. Parent group as a firm type with a child-firms list (Firm360 Parent_Code; manual row until the loader carries it).	The 27 user packages and the firm-package intersection rule.
2. A user may belong to a parent firm; RR validation uses the union of child ranges (configurable rule).	Radhika's matrix and ID Admin provisioning by hand.
3. One global parent package; modules that cannot run across firms stay child-only.	Compass user management screens and the bulk upload (create + update) tool.
4. Steward designation stored on the firm (group steward versus single-firm steward).	Okta identity model (identity plus one group label).
5. Access Requests module: form, status list, ID Admin queue, checklist, one-time credential.	Secured Zone Security App and existing SZ IDs (one SZ ID already spans a group; nothing is decoupled).
6. Duplicate-ID lookup by email at intake.	NetRep legacy request form.
7. First-sign-in event used to unblock the retire step.	R2 IDs per firm, linked for audit, until R2 functions move to Compass.
8. Request screens placed in an FSS-assignable package (Product Activation task, not development).	No feature registry, no system integration layer, no machine-generated instructions.

Sequencing that keeps today's architecture: build the parent firm type and the validation rule first (platform), the form and queue second (experience), sub-advisory as a second trading-only credential third, and the R2 decommission slice last.

Decisions this proposal depends on, and prompts for each group

Question	Who answers	Screen
Steward sees package names, or only business-level choices with ID Admin picking the package?	Owen, Radhika	A
Parent group scope: steward picks child firms, or always all children?	Candi, Ray	A, E
RR codes typed by the steward as today, or picked from Firm360 ranges?	Radhika	A
Secured Zone apps and NetRep inside the v1 form, or left on today's forms?	Candi	A, D
Who designates the group steward and where is it recorded?	Ray, Ed	E
Child firms for the pilot: wait for the Firm360 feed or allow the manual row?	Ray, JP	E
Which modules are parent-eligible on day one?	JP, Owen	E
Does validation read Firm360 live or the nightly copy in Compass?	JP	sequence

Group	Ask them
Design (Owen, Candi)	Can the form render from the package list and the firm data without the registry? Which screens from the UAR Figma survive as is?
Architecture (JP)	Effort band for the parent firm type and the RR union rule. Which modules filter by firm ID versus RR code. Cost of the first-sign-in event.
Operations (Radhika, Maisha)	Does the ID Admin checklist match the matrix flow? What is the exception path for non-standard profiles? Change management per firm, inside the launch windows.
Business (Ray, Kevin)	Which parent group pilots first. A blackout exception for one firm. The Firm360 loader date.
