Light UAR + multi-firm - end-to-end sequence

What happens, step by step, in the Compass X mock: one request from the group steward, fulfilled by the ID Admin team from the matrix, with no feature registry, no system integration layer and no automated provisioning. Sample data throughout: Harbourview Wealth Group (a stand-in for a real parent group), Jane Doe, request CUR-2026-0147. Firm names, people, IDs and RR codes are illustrative.

The four phases

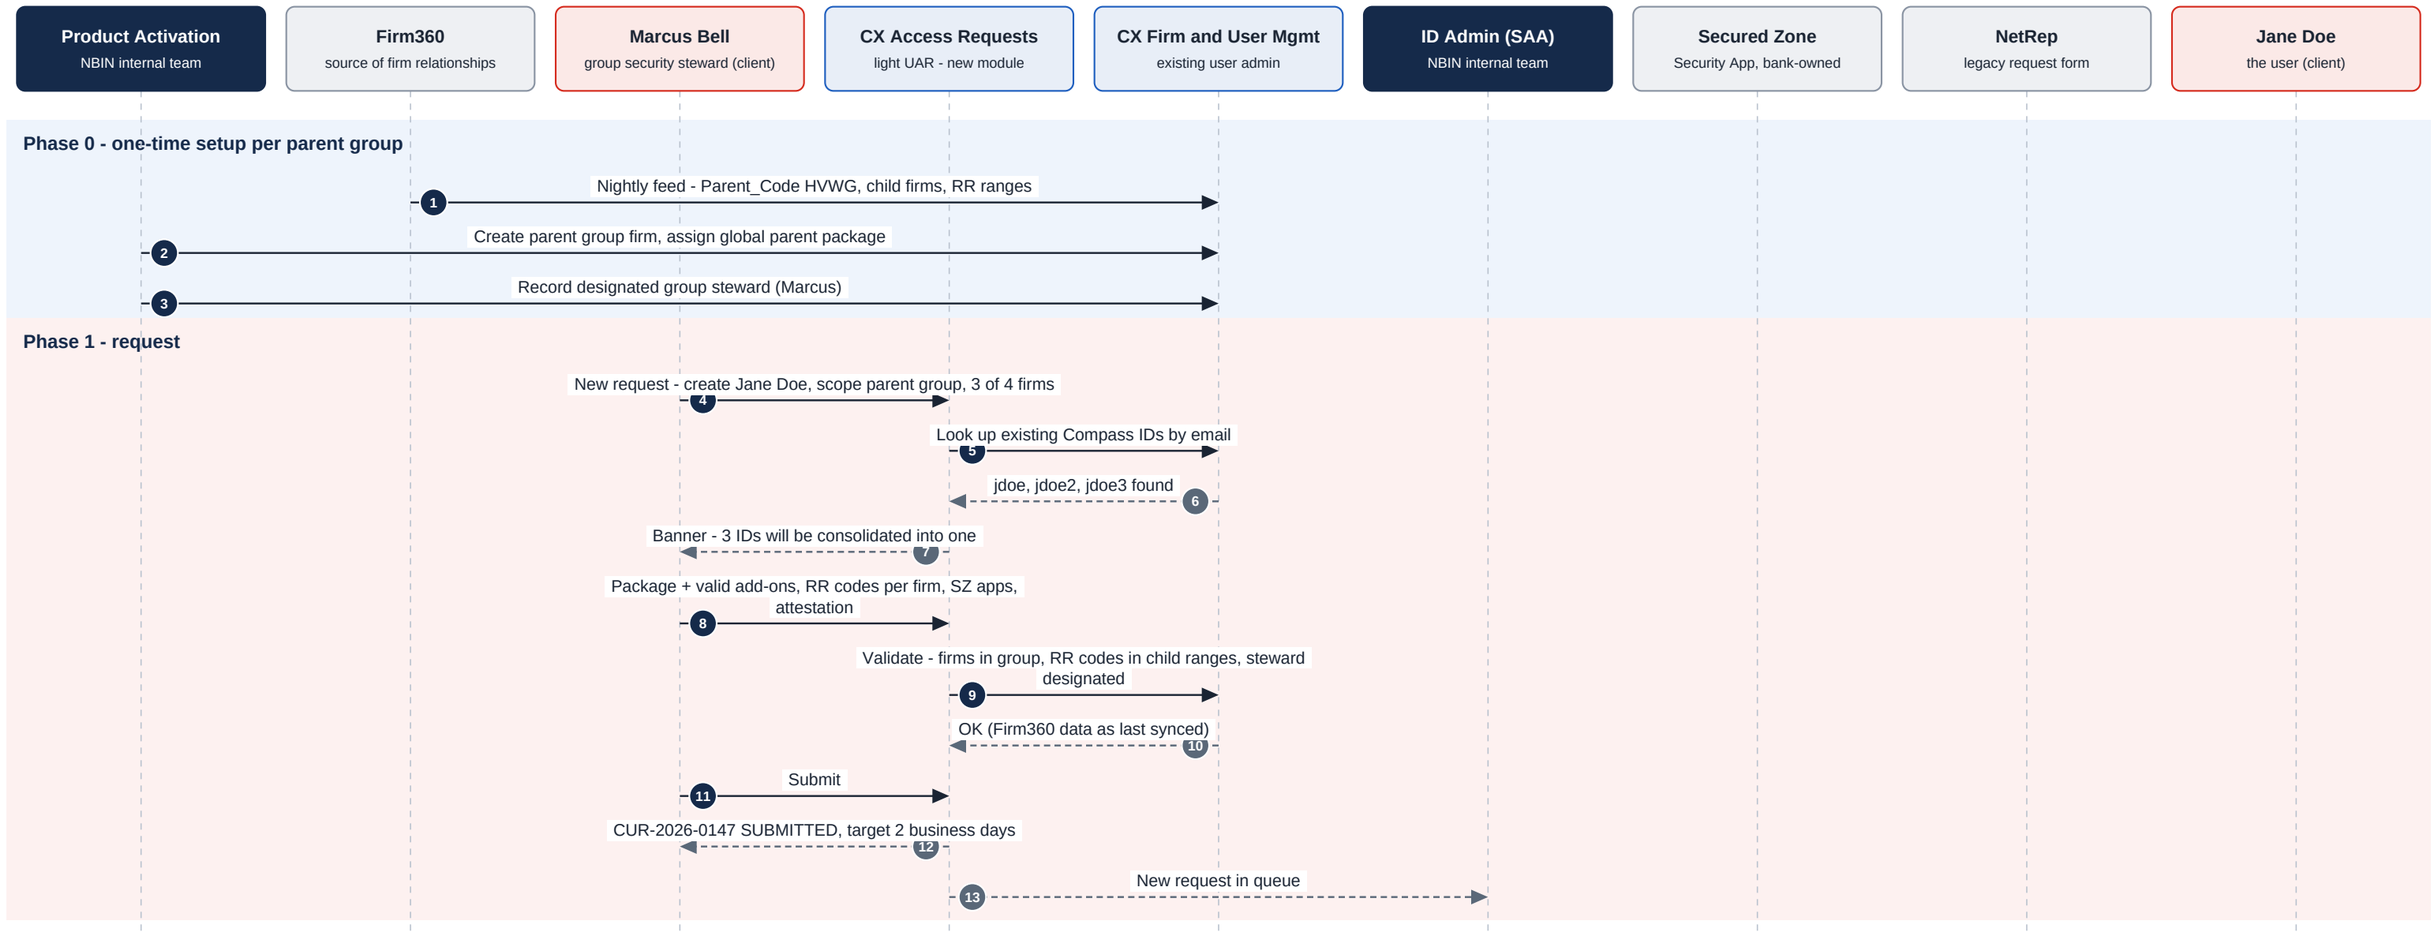
Phase	What happens	Who acts	What is new versus today
0 - Setup, once per parent group	Firm360 Parent_Code feeds the group and its child firms into Compass. Product Activation assigns the global parent package and records the designated group steward.	Firm360, Product Activation	Parent group as a firm type; global parent package; steward designation stored
1 - Request	The steward fills one form in Compass. The form checks existing IDs, group membership and RR ranges before submit.	Steward, the new request module	The form itself; duplicate-ID check; validation against firm data already in Compass
2 - Fulfil	ID Admin opens the matrix row, creates the user in today's user management, links the existing Secured Zone ID, raises NetRep only if asked, ticks the checklist, releases the password once.	ID Admin, by hand	Checklist and one-time password; user may belong to a parent group with RR codes across child firms
3 - Sign-in and retire	The person signs in with one ID and sees all three firms. The old IDs are deactivated afterwards with the bulk tool; R2 IDs stay linked for audit.	User, ID Admin	Retire-after-first-sign-in rule; R2 untouched; one row per person in the steward's list

Who is on the diagram

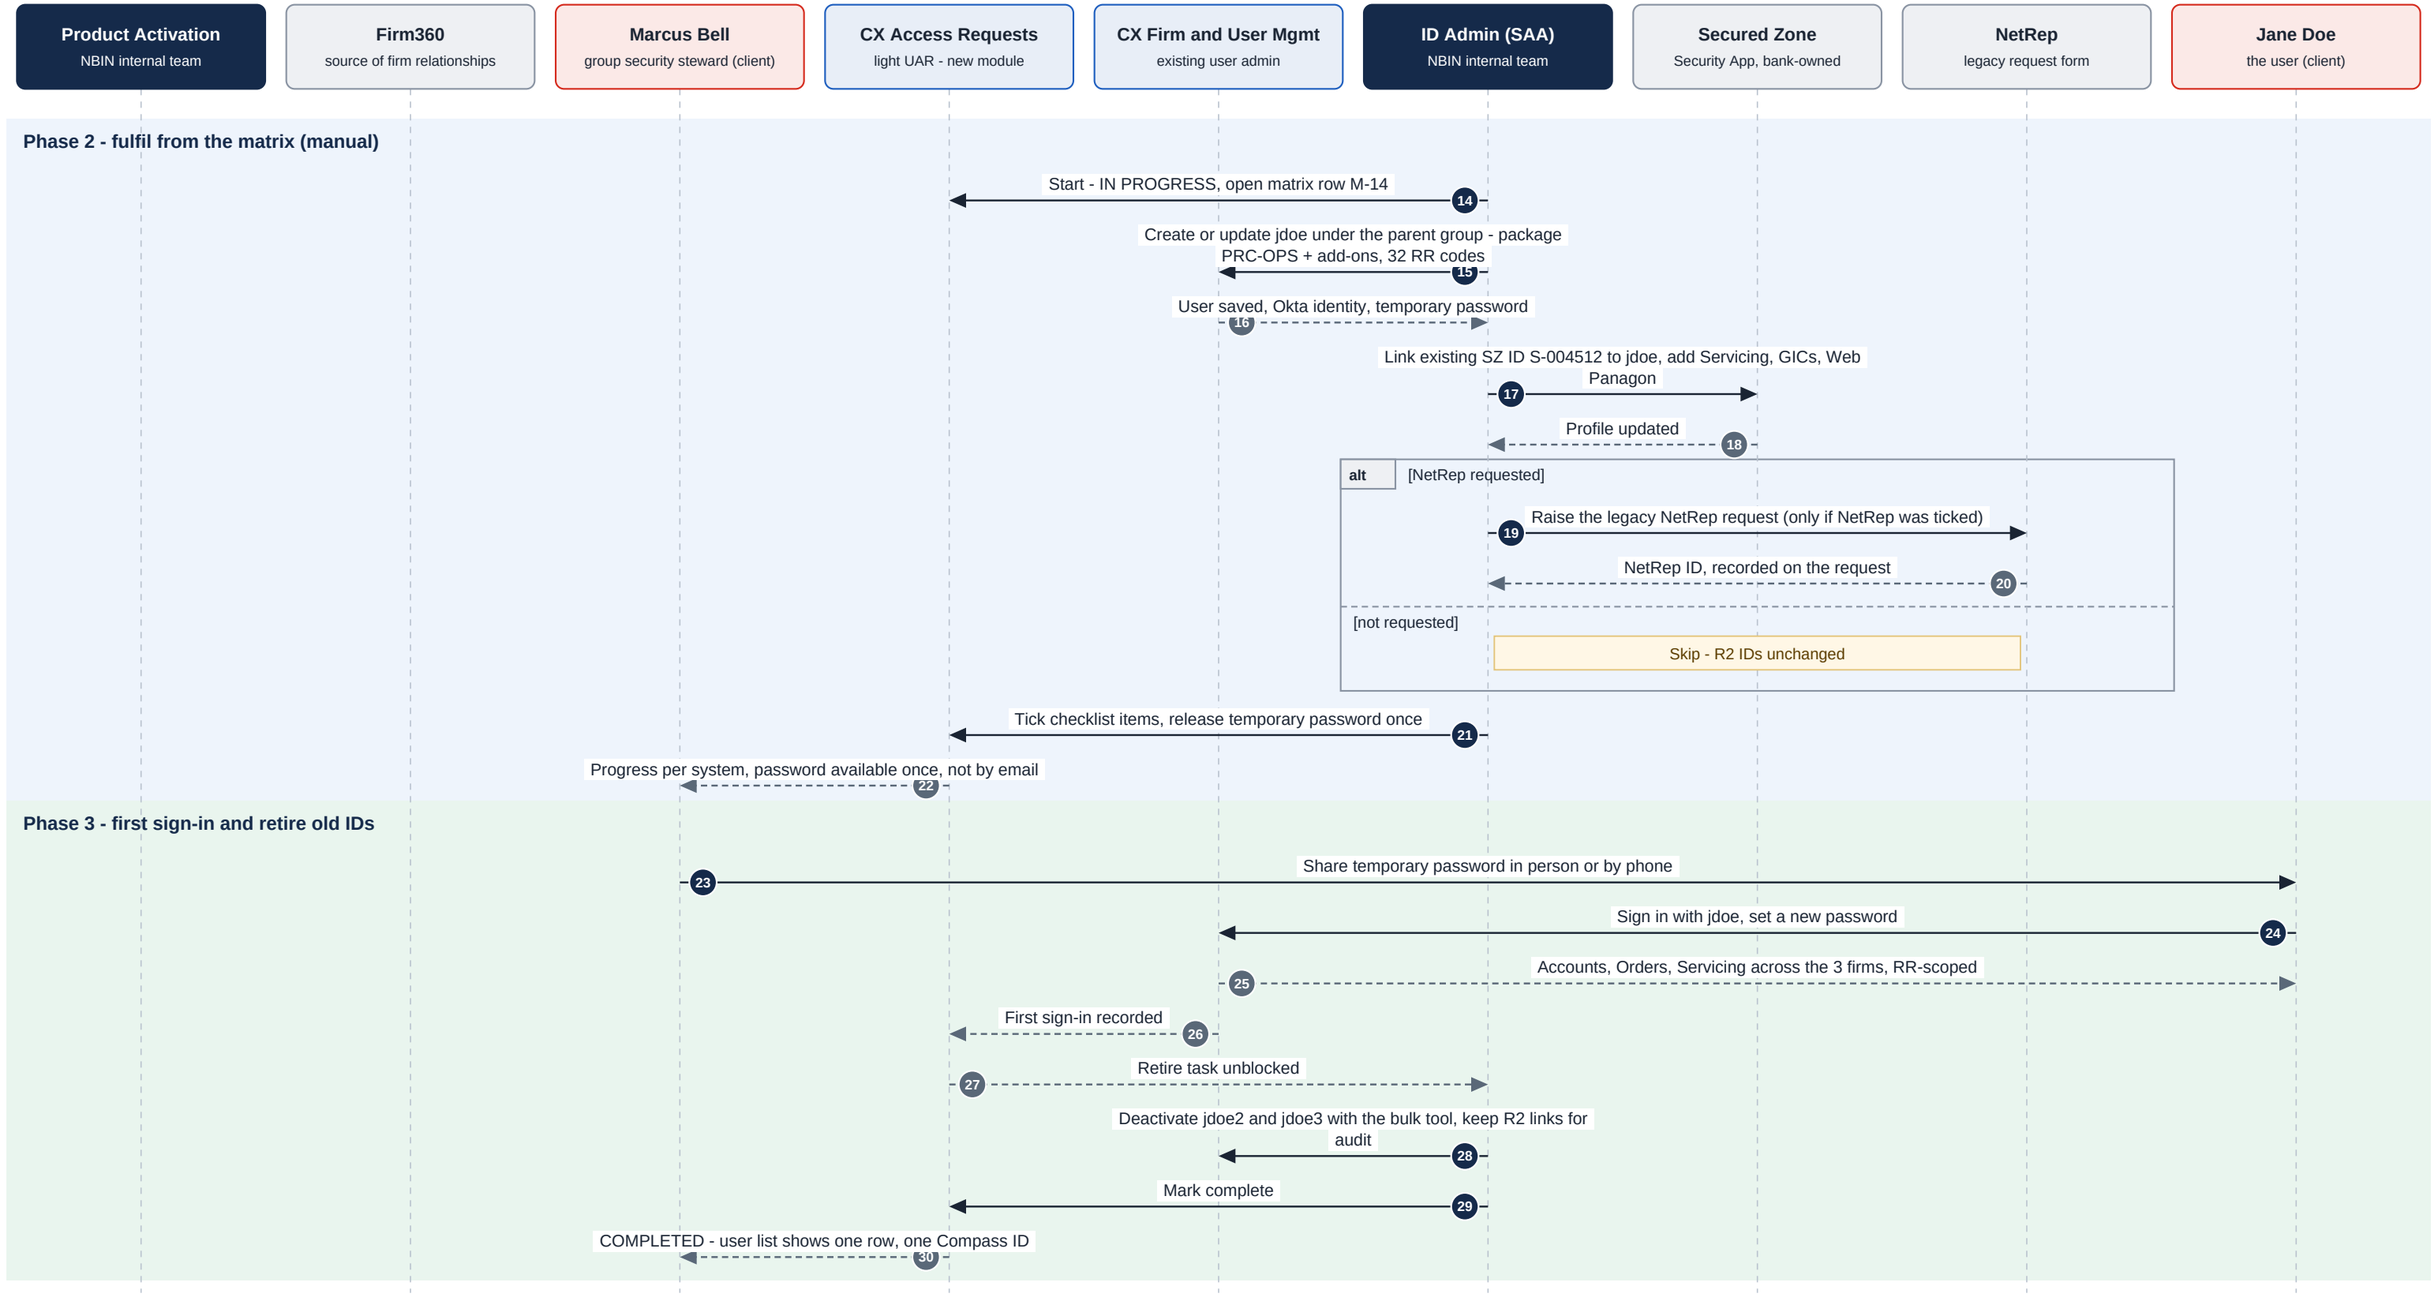
Lifeline	What it is	Type
Product Activation	NBIN internal team	NBIN internal team
Firm360	source of firm relationships	System outside Compass
Marcus Bell	group security steward (client)	Client-side person
CX Access Requests	light UAR - new module	Compass X component
CX Firm and User Mgmt	existing user admin	Compass X component
ID Admin (SAA)	NBIN internal team	NBIN internal team
Secured Zone	Security App, bank-owned	System outside Compass
NetRep	legacy request form	System outside Compass
Jane Doe	the user (client)	Client-side person

How to read the diagram pages: solid arrows are calls or actions, dashed arrows are responses or status updates, the number on each arrow is the step in the detail table, shaded bands are phases, and the boxed 'alt' section is the branch taken only when NetRep access was requested.

Sequence, part 1 - phases 0 and 1 (steps 1 to 13)



Sequence, part 2 - phases 2 and 3 (steps 14 to 30)



Step details

Every arrow on the diagram, with the data it carries, where it happens, and what is new compared with today's process.

#	Phase	From	To	Message (as on the diagram)	What moves	Where it happens	New versus today	Note
1	0	Firm360	CX Firm and User Mgmt	Nightly feed - Parent_Code HVWG, child firms, RR ranges	Parent code, child firm IDs and types, RR ranges	Firm360 -> CX firm table (nightly loader)	Loader must read Parent_Code (ticket NWPI-14039). Until then: manual child-firm row in firm settings	Ray: Firm360 stays the source; he can push Darwin's team for the date
2	0	Product Activation	CX Firm and User Mgmt	Create parent group firm, assign global parent package	Firm type = Parent, package = Parent group - all features, locked child-only modules	CX firm settings	New firm type; one global parent package (Penny's decision)	Which modules are parent-eligible on day one is still JP's and Owen's call
3	0	Product Activation	CX Firm and User Mgmt	Record designated group steward (Marcus)	Steward user ID, scope = all child firms, reference to signed steward form	CX firm settings - security stewards	Designation stored in CX (today: paper form and SAA's knowledge)	Who designates and where it is recorded is open (Ray, Ed)
4	1	Marcus Bell	CX Access Requests	New request - create Jane Doe, scope parent group, 3 of 4 firms	Request type, person fields, scope, selected child firms, access-from date	CX Access Requests (new module, FSS package)	One form in CX replaces My Request (R2) and the UAF for Compass access	NetRep and other external apps can stay on today's forms if the room prefers (Penny's descope)
5	1	CX Access Requests	CX Firm and User Mgmt	Look up existing Compass IDs by email	Work email	CX user table	Duplicate-identity check at intake (today nobody checks)	
6	1	CX Firm and User Mgmt	CX Access Requests	jdoe, jdoe2, jdoe3 found (response)	IDs, firm of each, status, linked SZ and R2 IDs	CX user table	Existing data, new use	
7	1	CX Access Requests	Marcus Bell	Banner - 3 IDs will be consolidated into one (response)	Display only	Form UI	New	Sets the expectation that two IDs will be retired after the switch
8	1	Marcus Bell	CX Access Requests	Package + valid add-ons, RR codes per firm, SZ apps, attestation	Package code, add-ons, RR codes per firm, SZ app list, NetRep flag, attestation, notes	CX Access Requests	Package-first picker; cascade rules from the 48-case analysis show only valid combinations	Replaces the a la carte menu Radhika objected to
9	1	CX Access Requests	CX Firm and User Mgmt	Validate - firms in group, RR codes in child ranges, steward designated	Selected firms vs child list; RR codes vs ranges; steward scope	CX firm data as synced from Firm360	RR validation uses the union of child ranges (make the rule configurable)	Today: RR codes must sit inside the user's single firm
10	1	CX Firm and User Mgmt	CX Access Requests	OK (Firm360 data as last synced) (response)	Validation result	CX	Validation is against the nightly copy, not live Firm360	
11	1	Marcus Bell	CX Access Requests	Submit	Request record CUR-2026-0147, submitter, timestamp	CX Access Requests	Request becomes a tracked object	
12	1	CX Access Requests	Marcus Bell	CUR-2026-0147 SUBMITTED, target 2 business days (response)	Status, SLA target	Steward's request list	Visible status and target date (today: unknown turnaround, 3 days to 3 months)	
13	1	CX Access Requests	ID Admin (SAA)	New request in queue (response)	Queue entry, notification	ID Admin queue	Structured queue replaces email and form intake	
14	2	ID Admin (SAA)	CX Access Requests	Start - IN PROGRESS, open matrix row M-14	Status change, assignee, matrix row reference	CX Access Requests; Radhika's matrix (unchanged)	Status visible to the steward; the matrix stays the source of instructions	Nothing is machine-generated
15	2	ID Admin (SAA)	CX Firm and User Mgmt	Create or update jdoe under the parent group - package PRC-OPS + add-ons, 32 RR codes	User record: firm = parent group, user package, add-on resources, RR codes across 3 firms	CX user management (existing screens)	A user may belong to a parent firm and hold RR codes across child ranges	This step is the whole multi-firm change on the platform side
16	2	CX Firm and User Mgmt	ID Admin (SAA)	User saved, Okta identity, temporary password (response)	Okta external identity + one group label; temporary password	CX + Okta	Existing behaviour	
17	2	ID Admin (SAA)	Secured Zone	Link existing SZ ID S-004512 to jdoe, add Servicing, GICs, Web Panagon	SZ ID to CX ID link; app entitlements in the Security App	Secured Zone Security App (bank-owned)	Nothing changes on the SZ side: one SZ ID already spans the group; it links to the one kept CX ID	Avoids the decouple-then-collapse work Radhika refused
18	2	Secured Zone	ID Admin (SAA)	Profile updated (response)	Confirmation	Secured Zone	Existing behaviour	
19	2	ID Admin (SAA)	NetRep	Raise the legacy NetRep request (only if NetRep was ticked)	NetRep request as today	NetRep legacy form	Today's process, unchanged	alt branch
20	2	NetRep	ID Admin (SAA)	NetRep ID, recorded on the request (response)	NetRep ID stored on CUR-2026-0147	CX Access Requests	ID captured on the request for audit	alt branch; else: skip, R2 IDs unchanged
21	2	ID Admin (SAA)	CX Access Requests	Tick checklist items, release temporary password once	Checklist state per system; one-time secret	CX Access Requests	Checklist and copy-once credential (today: password by email)	
22	2	CX Access Requests	Marcus Bell	Progress per system, password available once, not by email (response)	Status per system; reveal-once control	Steward's request detail	New	
23	3	Marcus Bell	Jane Doe	Share temporary password in person or by phone	Out of system	People	Policy, not software	
24	3	Jane Doe	CX Firm and User Mgmt	Sign in with jdoe, set a new password	Okta authentication; first-login flag	Okta + CX	Existing behaviour	

#	Phase	From	To	Message (as on the diagram)	What moves	Where it happens	New versus today	Note
25	3	CX Firm and User Mgmt	Jane Doe	Accounts, Orders, Servicing across the 3 firms, RR-scoped (response)	Effective access = parent firm package AND user package; data scope by RR codes	CX modules	Aggregation comes from RR codes across firms; firm labels in views still to decide	Owen's app pass: which modules show firm attribution, which cannot run in parent context
26	3	CX Firm and User Mgmt	CX Access Requests	First sign-in recorded (response)	Last-login event	CX	Trigger for the retire step	
27	3	CX Access Requests	ID Admin (SAA)	Retire task unblocked (response)	Checklist state	ID Admin queue	New	
28	3	ID Admin (SAA)	CX Firm and User Mgmt	Deactivate jdoe2 and jdoe3 with the bulk tool, keep R2 links for audit	Deactivate (freeze) two IDs; R2 IDs stay linked	CX bulk user actions (existing)	Existing tool, today's freeze semantics; no delete	IDs are touched once, and only after the kept ID is in use
29	3	ID Admin (SAA)	CX Access Requests	Mark complete	Status COMPLETED, completion time	CX Access Requests	New	
30	3	CX Access Requests	Marcus Bell	COMPLETED - user list shows one row, one Compass ID (response)	Status; user list refresh	Steward's screens	One row per person across the group	

What this flow changes on the platform, and what it leaves alone

Must change	Stays exactly as today
1. Parent group as a firm type in Compass, with a child-firms list (from Firm360 Parent_Code; manual row until the loader carries it). 2. A user may belong to a parent firm; RR-code validation uses the union of the child ranges (configurable rule). 3. One global parent package; modules that cannot run across firms stay child-only. 4. Steward designation stored on the firm (group steward versus single-firm steward). 5. New Access Requests module: form (create, update, deactivate), status list, ID Admin queue, checklist, one-time credential. 6. Duplicate-ID lookup by email at intake. 7. First-sign-in event used to unblock the retire step. 8. Request module screens placed in an FSS-assignable package (Product Activation task).	The 27 user packages and the firm-package intersection rule. Radhika's matrix and the ID Admin team provisioning by hand. Compass user management screens and the bulk upload (create + update) tool. Okta identity model (identity plus one group label). Secured Zone Security App and the existing SZ IDs (one SZ ID already spans a group; nothing is decoupled). NetRep legacy request form. R2 IDs per firm, linked for audit, until R2 functions move to Compass. No feature registry, no system integration layer, no machine-generated instructions.

Decisions this flow depends on

Question	Who answers	Where it bites
Steward sees package names, or only business-level choices with ID Admin picking the package?	Owen, Radhika	Steps 8, 14
Does parent group scope mean the steward picks child firms, or always all children?	Candi, Ray	Steps 4, 9
RR codes typed by the steward as today, or picked from Firm360 ranges?	Radhika	Steps 8, 9
Secured Zone apps and NetRep inside the v1 form, or left on today's forms?	Candi	Steps 8, 17, 19
Who designates the group steward and where is it recorded?	Ray, Ed	Step 3
Child firms for the pilot: wait for the Firm360 feed or allow the manual row?	Ray, JP	Step 1
Which modules are parent-eligible on day one?	JP, Owen	Steps 2, 25
Does validation read Firm360 live or the nightly copy in Compass?	JP	Steps 9, 10
