

Unified Multi-Firm Access

What it means in plain words, where the journey starts, what hurts today in Secured Zone and R2, and how Compass X fixes it — in pictures.

The idea

One person, one ID, scoped to every firm they legitimately serve — with the firm relationship stored, enforced and auditable.

Two shapes

Aggregation (parent → child, vertical) and delegation (firm → sub-advisor, horizontal). Same engine, different scope rules.

Why now

~40% of active firms are multi-firm; invalid cross-firm access has already been found; CX trading and SZ SSO both depend on it.

IN THIS BRIEF

The problem in one picture

Compass assumes one person belongs to one firm. Your clients stopped working that way — and the workarounds are what create the risk.

~40%
of active firms have a cross-firm relationship

85 → 184
parent groups → child firms (aggregation)

45 → 35
sub-advisors serving firms (delegation)

What people do today
They carry an ID per firm (and per system), or someone slips another firm's RR codes into a "sub-advisor" field so one ID can reach them.

Why it is a risk, not an annoyance
Nobody can prove which cross-firm access is legitimate. Invalid access has already been found — only after weeks of analysis.

Where the journey starts
With one person who needs to work on accounts in more than one firm: a parent-group back office, or a sub-advisor trading for another PM firm.

Two kinds of relationship

Aggregation is vertical (the parent owns the children). Delegation is horizontal (one firm lends a slice to another). The same engine handles both; the scope rules differ.

Aggregation — parent → child

vertical: the parent owns the children and needs the whole picture

Why parents exist

- M&A rebrand instead of converting accounts (Harbourfront, Croft)
- IB and PM arms kept as separate registrations (Wellington-Altus)
- PM + IFM pair grouped by NBIN for P&L reporting — a 'ghost parent' with no users, no accounts and no contract of its own

Analogy: a head-office badge that opens every building in the group

Delegation — primary firm → partner

horizontal: the firm lends a scoped slice of its accounts

What a sub-advisor gets (decision of Oct 2022)

- Trade, allocate and book baskets on delegated accounts
- Read-only client and account basics — no SIN, address or bank details
- No statements, tax documents, onboarding or servicing requests

Analogy: a contractor's key — specific rooms, for the contract term, revocable

Today — aggregation

Firm360 holds the hierarchy for billing;
CX does not know a parent exists

Today — delegation

a paper SAA validated by Risk;
no system of record any platform can read

Target — both

stored in CX FUM, enforced, synced with
Firm360 (new 8-character Parent_Code)

Aggregation — who

Harbourfront (5 children, 78 parent users), BCV, CWB McLean, Optimize, Fiera/CGOV, Guardian. 80% of parents have exactly two children.

Delegation — who

Guardian, Mawer, Fiera and BCV have the most sub-advisor users; RN Croft wants view-only for referral partners. Trend: fewer sub-advisors, more pooled funds.

Watch out

A ghost parent is only a reporting grouping — never treat it as a real parent. Multi-parent is a transitional edge case (Harbourfront + KJH before May 2026).

How big is this?

Roughly 40% of active firms have a cross-firm relationship, and the people inside them are the heaviest users of the platform.

Parent groups by number of child firms

Firms with the most sub-advisor users (R2)

Caveat: the SZ snapshot covers iMOST and GIC only. The Current State Aggregation table has its SZ row swapped with NetRep sub-advisor figures — quote the data-analysis page.

So what — aggregation

292 people already hold duplicate CX accounts across 34 parent groups. Yet 58% of parent groups have no parent user set up — the open question is why.

So what — delegation

741 R2 profiles carry sub-advisor RR codes; 88% hold ten or fewer, but 22 users hold "sub-advisor" codes inside their own firm range — a hack or an error.

So what — identity

In SZ alone 627 people hold 2-5 IDs, and two individuals hold 56 and 57 — almost certainly shared or vendor logins nobody can attribute.

The whole map

Both relationship types land in one place — CX firm & user management. Firm360 stays the source of truth, one request is the front door, and CX pushes a consistent answer to the legacy systems.

Firm360 ↔ CX

Hierarchy, subscriptions and the new Parent_Code flow down; usage and newly declared delegations flow back for invoicing.

One request

The unified access request replaces iMOST UAF and R2 myRequest, and carries firm context so ID Admin never guesses.

Downstream

SZ goes behind CX SSO, R2 is linked until it powers down, NetRep is replaced by CX trading, IIS tools inherit the parent structure.

The journey: today vs target

Same five steps for both relationship types. Today each step is done once per firm, by hand. In the target state it is done once per person, relationship-aware.

Today

Two request routes (R2 + UAF for IB, myRequest for PM/IFM); the FSS must choose which child firm the person "lives" in; everything per child firm.

Target

One form in CX under parent or child context; one ID; parent context by default; attestation and offboarding follow the relationship.

What stays manual for now

ID Admin still configures SZ, R2 and NetRep by hand until each is retired or integrated — but links every ID back to the CX profile.

Today's request maze

There is no Secured Zone request as such — SZ rides along on whichever route the child firm uses, and the steward has to know which one. Every route ends at the same manual desk.

Who hurts today

Five people feel the gap differently. The common thread: the platform cannot see the relationship, so every control falls back on human memory.

Parent-firm user

- 7-8 logins across CX, SZ, R2 and NetRep
- Switches environment by the advisor's email domain
- Re-logs in per child firm for SOMA approvals
- Can't search the whole book of business

Sub-advisor (delegate)

- Set up as an 'employee' of every PM firm they serve
- Own and delegated accounts co-mingled — must know RRs
- Sees client PII beyond what trading needs
- Access outlives the SAA unless someone remembers

Firm Security Steward

- Two request routes: R2+UAF (IB), myRequest (PM/IFM)
- Must pick which child firm the person 'lives' in
- Reconciles per-firm attestation files by hand
- Must remember every ID when someone leaves

NBIN ID Admin & support

- One person = 2+ requests across CX, R2, SZ, NetRep
- RR instructions arrive as free text in comments
- Never sees the firm relationship behind a request
- Multi-month triage to tie IDs to people at launch

Risk & Compliance

- No audit trail from access back to an agreement
- Stale access: leavers still hold logins
- Invalid cross-firm access found after weeks of analysis
- SZ grants more than R2/NR for the same person

Harbourfront

Multiple credentials is the biggest pain point; back office, compliance and accounting carry it for all acquired businesses. Toggling costs hours each day.

Guardian

Two IDs just for oversight is "a nuisance"; wants one ID with reporting by firm code and a consolidated view of who has access.

Fiera and RN Croft

Fiera: inconsistent SLAs and separate request routes for CGOV. Croft: view-only is the largest unmet need; users get more access than they asked for.

Secured Zone: the road

One multi-firm person travelling through Secured Zone. At each stop SZ has one limitation, and the limitation does something to the person. GICs are the exception that works.

Secured Zone: three paths

At "do the task" there are two ways through today, and the feature adds a third. The shortcut exists only because SZ lets you put another firm's RR codes on one ID with nothing behind it.

Many SZ IDs

Declared and auditable, but slow: ID switching all day, a request per ID, and leftovers at exit. The "compliant" path is the expensive one.

The RR shortcut

Fast and invisible: that is how SZ ends up granting more than NetRep or R2 for the same person. Nothing to check it against.

Why SZ matters more than R2

R2 is powered down in Oct 2027. SZ is not going away — it goes behind CX. So SZ consistency is a KPI the PRD must hit (FUM-E-186 then 194).

R2 (Compass Legacy): limits and sunset

R2 cannot be fixed in time and will not be. The plan is to link R2 IDs behind the CX profile, give ID Admin manual steps, and let the Oct 31, 2027 power-down remove the problem.

The solution in one picture

Add the missing third factor — the relationship — and collapse every person to one identity. Everything else in the PRD follows from these two moves.

What decides a person's access

The platform already has the first two. The relationship is the missing third factor.

Parent firm
modified core package: only features that work in aggregate

Delegate firm
view-only or trade-only bundle on the chosen RR codes

Relationship ends
access removal cascades to every linked ID

Store and enforce the relationship
Intent (the agreement), onboarding, and offboarding all become auditable objects in CX, synced with Firm360.

One ID, many firms
Parent users get a parent-level profile with RRs from chosen child firms; delegates get a home firm plus secondary firm(s) with a scoped slice.

Clear context, cascading exit
Firm context is always on screen; ending a relationship or a user removes access from every linked ID at once.

One person, one identity

Target journey by persona

Reading across: the five steps. Reading down: what each person does at that stop once the feature is live.

	Request	Provision	Use	Monitor	Offboard
Firm Security Steward parent or child firm	One form in CX; pick firm context, child firms, RRs, features	Tracks status; gets credentials back (48-hour SLA)	Sees every user across the group in one list	Attestation per firm, parent users flagged	One request; all linked IDs disabled
NBIN ID Admin provisions and links IDs	Structured intake; firm by ID, not name	Configure CX + SZ, R2, NetRep; link IDs to the CX profile	Fewer duplicate tickets to untangle	Usage report to Firm360 for invoicing	Deprovision all linked IDs in one pass
Parent-firm user ops, compliance, HQ	Asks their FSS (no self-service yet)	One ID, parent-level profile, RRs from chosen child firms	One login; parent context; filter by child; SSO to SZ	Appears once in attestation, as parent	Leaves once; nothing lingers
Delegate user sub-advisor or referral agent	Delegate FSS assigns them to the delegated firm	Home firm + secondary firm(s); scoped RRs	Delegated accounts in Orders next to own; trade, read basics	Visible to both FSS as a relationship	Relationship ends → access cascades off
Parent users Set up once, under parent context; operate across all assigned child firms with the same functions; legacy IDs ride behind the CX profile.		Delegate users Assigned by their own FSS to the firms that delegated to them; see delegated accounts next to their own; trade and read basics only.		Stewards and ID Admin One form, firm by ID, structured instructions, 48-hour SLA kept; the request cannot close until legacy IDs are linked.	

The whole picture: people, objects, steps

Everything on one page: who is involved (top), the systems and what lives in each (middle), and the eight steps of the journey (bottom). Numbered badges show where each step happens.

Sequence: provisioning a parent-firm user (target state)

From the Firm360 sync to the first login — and the single deactivation that closes everything.

Sequence: setting up and ending a delegation (target state)

The agreement is still signed on paper; everything after it becomes a system object in CX that both firms can see and that ends cleanly.

Still manual today

Emails about firms, users and RR codes; new RRs cut in AS400 and added to the sub-advisor firm's range in NetRep; a signed agreement filed with Risk.

What changes

The relationship becomes a record: delegate firm ID, feature level, RR codes. Attestation shows it to both firms; termination cascades.

Decisions needed

A signature (not online acknowledgement) is required before setup. The SZ bundle for sub-advisors must reconcile the 2022 decision with the PRD.

How this connects to the other work

Multi-firm was chosen over the resource-model redesign as the next major initiative because it touches every part of the UAM programme.

Roadmap and dates

PRD is still a draft. NOW is the aggregation and delegation core; NEXT adds monitoring and feature management; LATER extends to external-SSO firms.

Phasing

NOW: parent setup, provisioning, platform access, delegate setup. NEXT: monitoring, firm feature management. LATER: external SSO hierarchy.

Pilot logic

Beta and pilot with firms that have no sub-advisory; sub-advisors move only after CX trading GA, so ~May 2027 is the drop-dead.

Dependencies

Firm360 Parent_Code feed and FUM update (NWPI-14039, unscheduled); SZ SSO & FGDA; Feature Registry; unified access request.

Open questions and likely questions

Left: what is still undecided and who owns it. Right: the questions you are most likely to get, with a one-breath answer.

#	Open question	Owner	Status
1	Firm360 integration: API or the nightly file?	Ray Norris · solution design	Open
2	Trading "behalf code" when a parent has more than one IB firm	Zheng	Pending
3	Which apps cannot aggregate: TA & MF upload, MaxLite, restricted IIS tools	Joe · Stan · IIS	Open
4	Default landing and white-label for a parent-firm user	Owen	Parked
5	Who designates the parent FSS; signature (not online tick) before delegation	Product · Risk	Open
6	R2 cross-broker RR limitation	—	Accepted interim risk
7	Billing of add-on licences when one person spans IB and PM	Bill (Finance) · Ray	Open
8	Sub-advisor SZ rights: 2022 decision vs PRD bundle vs 2023 use cases	Stan · Candi	Needs decision
9	58% of parent groups have no parent user — why?	Candi · Radhika	Analysis

If someone asks...	Say
Why not just keep multiple IDs?	Because the cost is risk, not convenience: invalid access found weeks late, attestations that cannot see parent users, and leavers who keep a login.
Doesn't Firm360 already do this?	It holds the hierarchy for billing. Nothing enforces it in access — Compass does not know a parent exists.
Why is delegation harder than aggregation?	There is no source of truth at all: the agreement is paper, R2 checks the RR range but never the agreement, and scope or duration live nowhere.
What happens to R2?	Nothing gets fixed in R2. IDs are linked behind the CX profile and R2 is powered down on Oct 31, 2027.
When?	NOW scope designed through 2026; pilot early 2027 with firms that have no sub-advisory; sub-advisors after CX trading GA (~May 2027).
What do you need from this group?	Owners and decisions on questions 1–5 and 8, and agreement that the SZ bundle and the Firm360 feed are on the critical path.

Cheat sheet: terms and numbers

Everything you might need to decode a sentence in the room.

Term	Meaning
Aggregation	Parent → child firm relationship; the parent oversees and operates across its children.
Delegation	Firm → partner relationship; the firm lends a scoped slice (RR codes, limited features) to another registered firm.
Parent / child firm	A holding group and its separately registered firms (IB, PM, IFM). Grouped in Firm360.
Ghost parent	A Firm360 grouping created by NBIN for P&L reporting only — no users, accounts or contract.
Sub-advisor	A registered PM firm managing part of another firm's portfolios under a Sub-Advisory Agreement (SAA).
Referral agent	A partner that refers clients; typically view-only or onboarding access, with a referral fee.
FSS	Firm Security Steward — the client-side admin who requests, reviews and removes user access.
ID Admin	NBIN team that provisions users across CX, R2, SZ and NetRep; 48-hour SLA.
Firm360 / Parent_Code	NBIN firm master: hierarchy, subscriptions, invoicing. Parent_Code is the new 8-character stable parent ID.

Term	Meaning
RR code / broker code	Rep code identifying an advisor's book; broker code identifies the firm environment. R2 keeps RRs inside the broker code.
CX FUM	Compass X Firm & User Management — firm settings, user settings, packages, the home of the new relationship model.
Firm package n user package	Effective access today = what the firm subscribed n the person's role. Multi-firm adds relationship scope.
Feature Registry	Capability → Feature → Module model; needs parent/child eligibility flags and Firm360 sync.
UAF / myRequest	Today's two request routes: Unified Access Form in iMOST (IB) and R2 myRequest (PM/IFM). Both to be replaced.
SZ / R2 / NetRep / IIS	Secured Zone (12 apps, goes behind CX SSO); Compass Legacy (off Oct 31, 2027); trading platform (replaced by CX trading); data tools.
FGDA	Downstream RR-access enforcement that multi-firm must feed; its RR source of truth (AS400, Firm360, CX) still needs cleanup.
FUM-E-186 / 194	Aha epics: CX-to-SZ integration for single-firm users, then for parent-firm users and PM sub-advisors.
FUM-E-144	Employee Access — the same primary-ID-plus-linked-IDs pattern, for NBIN staff.

NUMBERS TO REMEMBER

~40%
active firms with a cross-firm relationship

85 / 184
parent groups / child firms

45 / 35
sub-advisors / firms served

292
people with duplicate CX accounts

741 / 846
R2 sub-advisor profiles / RR codes

627
SZ people with 2–5 IDs

7–8
logins per Harbourfront power user

48 h
provisioning SLA to keep

Oct 31, 2027
R2 powered down
